

Control User Guide

Digitax HD M751 Series

Variable Speed AC drive for Servo and Induction motors

Part Number: 0478-0460-03

Issue: 3

Original Instructions

For the purposes of compliance with the EU Machinery Directive 2006/42/EC, the English version of this manual is the Original Instructions. Manuals in other languages are Translations of the Original Instructions.

Documentation

Manuals are available to download from the following locations: http://www.drive-setup.com/ctdownloads

The information contained in this manual is believed to be correct at the time of printing and does not form part of any contract. The manufacturer reserves the right to change the specification of the product and its performance, and the contents of the manual, without notice.

Warranty and Liability

In no event and under no circumstances shall the manufacturer be liable for damages and failures due to misuse, abuse, improper installation, or abnormal conditions of temperature, dust, or corrosion, or failures due to operation outside the published ratings. The manufacturer is not liable for consequential and incidental damages. Contact the supplier of the dive for full details of the warranty terms.

Environmental policy

Control Techniques Ltd operates an Environmental Management System (EMS) that conforms to the International Standard ISO 14001.

Further information on our Environmental Policy can be found at: http://www.drive-setup.com/environment

Restriction of Hazardous Substances (RoHS)

The products covered by this manual comply with European and International regulations on the Restriction of Hazardous Substances including EU directive 2011/65/EU and the Chinese Administrative Measures for Restriction of Hazardous Substances in Electrical and Electronic Products.

Disposal and Recycling (WEEE)

When electronic products reach the end of their useful life, they must not be disposed of along with domestic waste but should be recycled by a specialist recycler of electronic equipment. Control Techniques products are designed to be easily dismantled into their major component parts for efficient recycling. The majority of materials used in the product are suitable for recycling.

Product packaging is of good quality and can be re-used. Large products are packed in wooden crates. Smaller products are packaged in strong cardboard cartons which have a high recycled fibre content. Cartons can be re-used and recycled. Polythene, used in protective film and bags for wrapping the product, can be recycled. When preparing to recycle or dispose of any product or packaging, please observe local legislation and best practice.

REACH legislation

EC Regulation 1907/2006 on the Registration, Evaluation, Authorisation and restriction of Chemicals (REACH) requires the supplier of an article to inform the recipient if it contains more than a specified proportion of any substance which is considered by the European Chemicals Agency (ECHA) to be a Substance of Very High Concern (SVHC) and is therefore listed by them as a candidate for compulsory authorisation.

Further information on our compliance with REACH can be found at: http://www.drive-setup.com/reach

How to use this guide

This guide is intended to be used in conjunction with the *Digitax HD M75X Series Installation and Technical Guide*. The *Installation and Technical Guide* gives information necessary to install the drive. This guide gives information on drive configuration, operation and optimization.

NOTE

There are specific safety warnings throughout this guide, located in the relevant sections. In addition, Chapter 1 Safety information contains general safety information. It is essential that the warnings are observed and the information considered when working with or designing a system using the drive.

This map of the user guide helps to find the right sections for the task you wish to complete, but for specific information, refer to Contents on page 4:

EU Declaration of Conformity

Nidec Control Techniques Ltd, The Gro, Newtown, Powys, SY16 3BE,

UK.

This declaration is issued under the sole responsibility of the manufacturer. The object of the declaration is in conformity with the relevant European Union harmonization legislation. The declaration applies to the variable speed drive products shown below:

Model number	Interpretation	Nomenclature aaaa - bbc ddddde
aaaa	Basic series	M100, M101, M200, M201, M300, M400, M600, M700, M701, M702, M708, M709, M751, M753, M754, F300, H300, E200, E300, HS30, HS70, HS71, HS72, M000, RECT
bb	Frame size	01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11
С	Voltage rating	1 = 100 V, 2 = 200 V, 4 = 400 V, 5 = 575 V, 6 = 690 V
ddddd	Current rating	Example 01000 = 100 A
е	Drive format	A = 6P Rectifier + Inverter (internal choke), D = Inverter, E = 6P Rectifier + Inverter (external choke), T = 12P Rectifier + Inverter (external choke)

The model number may be followed by additional characters that do not affect the ratings.

The variable speed drive products listed above have been designed and manufactured in accordance with the following European harmonized standards:

EN 61800-5-1:2007	Adjustable speed electrical power drive systems - Part 5-1: Safety requirements - Electrical, thermal and energy
EN 61800-3: 2004+A1:2012	Adjustable speed electrical power drive systems - Part 3: EMC requirements and specific test methods
EN 61000-6-2:2005	Electromagnetic compatibility (EMC) - Part 6-2: Generic standards - Immunity for industrial environments
EN 61000-6-4: 2007+ A1:2011	Electromagnetic compatibility (EMC) - Part 6-4: Generic standards - Emission standard for industrial environments
EN 61000-3-2:2014	Electromagnetic compatibility (EMC) - Part 3-2: Limits for harmonic current emissions (equipment input current ≤ 16 A per phase)
EN 61000-3-3:2013	Electromagnetic compatibility (EMC) - Part 3-3: Limitation of voltage changes, voltage fluctuations and flicker in public, low voltage supply systems, for equipment with rated current ≤ 16 A per phase and not subject to conditional connection

EN 61000-3-2:2014 Applicable where input current < 16 A. No limits apply for professional equipment where input power \geq 1 kW.

These products comply with the Restriction of Hazardous Substances Directive (2011/65/EU), the Low Voltage Directive (2014/35/EU) and the Electromagnetic Compatibility Directive (2014/30/EU).

Jonathan Holman-White Director, Technology Date: 14th May 2018

These electronic drive products are intended to be used with appropriate motors, controllers, electrical protection components and other equipment to form complete end products or systems. Compliance with safety and EMC regulations depends upon installing and configuring drives correctly, including using the specified input filters.

The drives must be installed only by professional installers who are familiar with requirements for safety and EMC. Refer to the Product Documentation. An EMC data sheet is available giving detailed information. The assembler is responsible for ensuring that the end product or system complies with all the relevant laws in the country where it is to be used.

EU Declaration of Conformity (including 2006 Machinery Directive)

Nidec Control Techniques Ltd

The Gro

IMPORTANT NOTICE

These electronic drive products are intended to be used with appropriate motors, controllers, electrical protection components and other equipment to form complete end products or systems. It is the responsibility of the installer to ensure that the design of the complete machine, including its safety-related control system, is carried out in accordance with the requirements of the Machinery Directive and any other relevant legislation. The use of a safety-related drive in itself does not ensure the safety of the machine. Compliance with safety and EMC regulations depends upon installing and configuring drives correctly, including using the specified input filters. The drive must be installed only by professional installers who are familiar with requirements for safety and EMC. The assembler is responsible for ensuring that the end product or system complies with all relevant laws in the country where it is to be used. For more information regarding Safe Torque Off, refer to the Product Documentation.

Mechanical Safety information Product Electrical Getting Basic Running SD Card Onboard Advanced **UL** listing Optimization Diagnostics parameters the moto Operation parameters information

Safety information

1.1 Warnings, Cautions and Notes

A Warning contains information which is essential for avoiding a safety hazard.

A Caution contains information which is necessary for avoiding a risk of damage to the product or other equipment.

A Note contains information which helps to ensure correct operation of the product.

1.2 Important safety information. Hazards. Competence of designers and installers

This guide applies to products which control electric motors either directly (drives) or indirectly (controllers, option modules and other auxiliary equipment and accessories). In all cases the hazards associated with powerful electrical drives are present, and all safety information relating to drives and associated equipment must be observed.

Specific warnings are given at the relevant places in this guide.

Drives and controllers are intended as components for professional incorporation into complete systems. If installed incorrectly they may present a safety hazard. The drive uses high voltages and currents, carries a high level of stored electrical energy, and is used to control equipment which can cause injury. Close attention is required to the electrical installation and the system design to avoid hazards either in normal operation or in the event of equipment malfunction.

System design, installation, commissioning/start-up and maintenance must be carried out by personnel who have the necessary training and competence. They must read this safety information and this guide carefully.

1.3 Responsibility

It is the responsibility of the installer to ensure that the equipment is installed correctly with regard to all instructions given in this guide. They must give due consideration to the safety of the complete system, so as to avoid the risk of injury both in normal operation and in the event of a fault or of reasonably foreseeable misuse.

The manufacturer accepts no liability for any consequences resulting from inappropriate, negligent or incorrect installation of the equipment.

1.4 Compliance with regulations

The installer is responsible for complying with all relevant regulations, such as national wiring regulations, accident prevention regulations and electromagnetic compatibility (EMC) regulations. Particular attention must be given to the cross-sectional areas of conductors, the selection of fuses or other protection, and protective ground (earth) connections.

This guide contains instructions for achieving compliance with specific EMC standards.

All machinery to be supplied within the European Union in which this product is used must comply with the following directives:

2006/42/EC Safety of machinery.

2014/30/EU: Electromagnetic Compatibility.

Electrical hazards 1.5

The voltages used in the drive can cause severe electrical shock and/or burns, and could be lethal. Extreme care is necessary at all times when working with or adjacent to the drive. Hazardous voltage may be present in any of the following locations:

- AC and DC supply cables and connections
- Output cables and connections
- Many internal parts of the drive, and external option units

Unless otherwise indicated, control terminals are single insulated and must not be touched.

The supply must be disconnected by an approved electrical isolation device before gaining access to the electrical connections.

The STOP and Safe Torque Off functions of the drive do not isolate dangerous voltages from the output of the drive or from any external option unit

The drive must be installed in accordance with the instructions given in this guide. Failure to observe the instructions could result in a fire hazard.

1.6 Stored electrical charge

The drive contains capacitors that remain charged to a potentially lethal voltage after the AC supply has been disconnected. If the drive has been energized, the AC supply must be isolated at least ten minutes before work may continue.

Mechanical hazards 1.7

Careful consideration must be given to the functions of the drive or controller which might result in a hazard, either through their intended behaviour or through incorrect operation due to a fault. In any application where a malfunction of the drive or its control system could lead to or allow damage, loss or injury, a risk analysis must be carried out, and where necessary, further measures taken to reduce the risk - for example, an over-speed protection device in case of failure of the speed control, or a fail-safe mechanical brake in case of loss of motor braking.

With the sole exception of the Safe Torque Off function, none of the drive functions must be used to ensure safety of personnel, i.e. they must not be used for safety-related functions.

The Safe Torque Off function may be used in a safety-related application. The system designer is responsible for ensuring that the complete system is safe and designed correctly according to the relevant safety standards.

The design of safety-related control systems must only be done by personnel with the required training and experience. The Safe Torque Off function will only ensure the safety of a machine if it is correctly incorporated into a complete safety system. The system must be subject to a risk assessment to confirm that the residual risk of an unsafe event is at an acceptable level for the application.

1.8 Access to equipment

Access must be restricted to authorized personnel only. Safety regulations which apply at the place of use must be complied with.

1.9 **Environmental limits**

Instructions in this guide regarding transport, storage, installation and use of the equipment must be complied with, including the specified environmental limits. This includes temperature, humidity, contamination, shock and vibration. Drives must not be subjected to excessive physical force.

1.10 Hazardous environments

The equipment must not be installed in a hazardous environment (i.e. a potentially explosive environment).

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Optimization	SD Card	Onboard	Advanced	Diagnostics	UL listing
information	information	installation	installation	started	parameters	the motor	Optimization	Operation	PLC	parameters	Diagnostics	information

1.11 Motor

The safety of the motor under variable speed conditions must be ensured

To avoid the risk of physical injury, do not exceed the maximum specified speed of the motor.

Low speeds may cause the motor to overheat because the cooling fan becomes less effective, causing a fire hazard. The motor should be installed with a protection thermistor. If necessary, an electric forced vent fan should be used.

The values of the motor parameters set in the drive affect the protection of the motor. The default values in the drive must not be relied upon. It is essential that the correct value is entered in the Motor Rated Current parameter.

1.12 Mechanical brake control

Any brake control functions are provided to allow well co-ordinated operation of an external brake with the drive. While both hardware and software are designed to high standards of quality and robustness, they are not intended for use as safety functions, i.e. where a fault or failure would result in a risk of injury. In any application where the incorrect operation of the brake release mechanism could result in injury, independent protection devices of proven integrity must also be incorporated.

1.13 Adjusting parameters

Some parameters have a profound effect on the operation of the drive. They must not be altered without careful consideration of the impact on the controlled system. Measures must be taken to prevent unwanted changes due to error or tampering.

1.14 Electromagnetic compatibility (EMC)

Installation instructions for a range of EMC environments are provided in the *Digitax HD M75X Series Installation and Technical Guide*. If the installation is poorly designed or other equipment does not comply with suitable standards for EMC, the product might cause or suffer from disturbance due to electromagnetic interaction with other equipment. It is the responsibility of the installer to ensure that the equipment or system into which the product is incorporated complies with the relevant EMC legislation in the place of use.

2 Product information

The *Digitax HD M75X series* is a range of high performance servo drives used as a standalone single axis or easily configured for multi-axis systems. Functionality also allows for this range of drives to be reconfigured for high performance universal AC motor control.

2.1 Introduction

Servo and Universal AC drive

This product family consists of the following variants:

- · Digitax HD M751 Base
- Digitax HD M753 EtherCAT

Common features (Digitax HD M751 and M753)

- Universal high performance open and closed loop control for induction, servo, permanent magnet and linear motors using Unidrive M motor control algorithms.
- Onboard IEC 61131-3 programmable automation and motion control.
- · Flexibility with speed and position measurement, supporting multiple devices and all common interfaces.
- · SD Media Card slot for parameter copying and data storage.
- · Dual channel Safe Torque Off (STO) input.
- · Simplified wiring and networking for multi-axis arrangements.
- · Connect support for quick start commissioning/start up (downloadable from controltechniques.com).
- · Option module connectable.

Variant description summary (Digitax HD M751 and M753)

Digitax HD M751 Base

- EIA-485 serial communications interface
- · Option module support as standard for configuration and flexibility

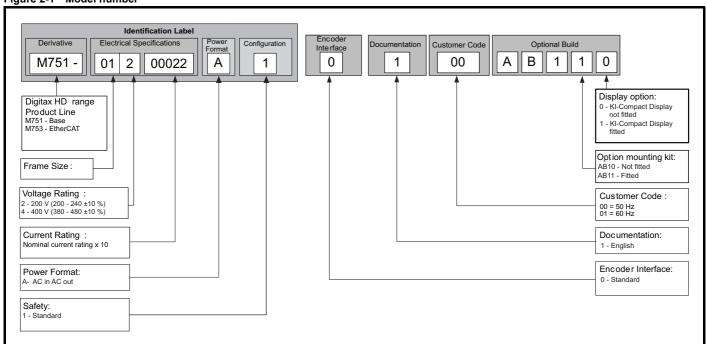

Digitax HD M753 EtherCAT

- Onboard EtherCAT slave for centralized motion control and accurate synchronization applications.
- · 2 integrated EtherCAT ports

2.2 Model number

The way in which the model numbers for the Digitax HD M75X series product range are formed is illustrated below:

Figure 2-1 Model number

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Ontimization	SD Card	Onboard	Advanced	Diagnostico	UL listing
information	information	installation	installation	started	parameters	the motor	Optimization	Operation	PLC	parameters	Diagnostics	information

2.3 Operating modes

The drive is designed to operate in any of the following modes:

1. RFC - S

With position feedback sensor Without position feedback sensor (Sensorless)

2. Open loop mode

Open loop vector mode Fixed V/F mode (V/Hz)

Quadratic V/F mode (V/Hz)

3. RFC - A

With position feedback sensor

Without position feedback sensor (Sensorless)

As a range of high performance servo drives, the Digitax HD M75X series are initially factory configured for RFC-S mode. The operating mode will need to be re-configured for AC induction motor control (open loop or RFC-A mode).

2.3.1 RFC-S

Rotor Flux Control for Synchronous (permanent magnet brushless) motors (RFC-S) provides closed loop control with position feedback device.

With position feedback

For use with permanent magnet brushless motors with a feedback device installed.

The drive directly controls the speed of the motor using the feedback device to ensure the rotor speed is exactly as demanded.

Absolute position information is required from the feedback device to ensure the output voltage is accurately matched to the back EMF of the motor. Full torque is available across the entire speed range.

Without position feedback (Sensorless)

For permanent magnet brushless motor control without a feedback device, using current, voltages and key motor parameters for motor control.

2.3.2 Open loop mode

The drive applies power to the motor at frequencies varied by the user. The motor speed is a result of the output frequency of the drive and slip due to the mechanical load. The drive can improve the speed control of the motor by applying slip compensation. The performance at low speed depends on whether V/F mode or open loop vector mode is selected.

Open loop vector mode

The voltage applied to the motor is directly proportional to the frequency except at low speed where the drive uses motor parameters to apply the correct voltage to keep the flux constant under varying load conditions.

Typically 100 % torque is available down to 1 Hz for a 50 Hz motor.

Fixed V/F mode

The voltage applied to the motor is directly proportional to the frequency except at low speed where a voltage boost is provided which is set by the user. This mode can be used for multi-motor applications.

Typically 100 % torque is available down to 4 Hz for a 50 Hz motor.

Quadratic V/F mode

The voltage applied to the motor is directly proportional to the square of the frequency except at low speed where a voltage boost is provided which is set by the user. This mode can be used for running fan or pump applications with quadratic load characteristics or for multi-motor applications. This mode is not suitable for applications requiring a high starting torque.

2.3.3 RFC-A mode

Rotor Flux Control for Asynchronous (induction) motors (RFC-A) encompasses closed loop vector control with a position feedback device.

With position feedback

For use with induction motors with a feedback device installed. The drive directly controls the speed of the motor using the feedback device to ensure the rotor speed exactly as demanded. Motor flux is accurately controlled at all times to provide full torque all the way down to zero speed.

Without position feedback (Sensorless)

Sensorless mode provides closed loop control without the need for position feedback by using current, voltages and key motor parameters to estimate the motor speed. It can eliminate instability traditionally associated with open loop control such as operating large motors with light loads at low frequencies.

^{*} This feedback device provides very low resolution feedback and should not be used for applications requiring a high level of performance.

2.5 Nameplate description

The following labels are attached to the drive.

NOTE

Date code format

The date code is four numbers. The first two numbers indicate the year and the remaining numbers indicate the week of the year in which the drive was built.

Example: A date code of 1710 would correspond to week 10 of year 2017.

2.6 Options

All standard option modules are color-coded in order to make identification easy. All modules have an identification label on top of the module. Standard option modules can be installed to any of the available option slots on the drive. The following tables shows the color-code key and gives further details on their function.

Table 2-2 Option module identification

Туре	Option module*	Color	Name	Further Details
		Purple	SI-PROFIBUS	PROFIBUS option PROFIBUS adapter for communications with the drive
		Medium Grey	SI-DeviceNet	DeviceNet option DeviceNet adapter for communications with the drive
-		Light Grey	SI-CANopen	CANopen option CANopen adapter for communications with the drive
Fieldbus		Beige	SI-Ethernet	External Ethernet module that supports EtherNet/IP, Modbus TCP/IP and RTMoE. The module can be used to provide high speed drive access, global connectivity and integration with IT network technologies, such as wireless networking
		Yellow Green	SI-PROFINET V2	PROFINET V2 option PROFINET V2 adapter for communications with the drive Note: PROFINET V2 replaces PROFINET RT.
		Brown Red	SI-EtherCAT	EtherCAT option EtherCAT adapter for communications with the drive
Automation (I/O expansion)	manufer	Orange	SI-I/O	Extended I/O Increases the I/O capability by adding the following combinations: Digital I/O Digital Inputs Analog Inputs (differential or single ended) Analog Output Relays

3 Mechanical installation

3.1 SI-Option module installation

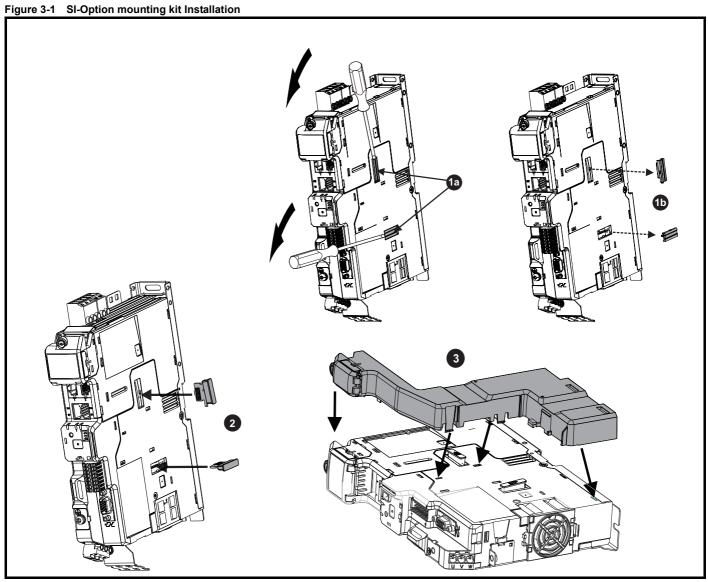

Remove the AC/DC power as well as the 24 Vdc supply to the drive before installing / removing the option module. Failure to do so may result in damage to the product.

Care must be taken when handling the option module interface card to avoid contaminating the gold contacts. Gold contacts must not be touched directly, handle the interface card using the protective cover provided in the mounting kit.

When connecting SI-option modules, an additional SI-Option mounting kit is required. If the drive is not supplied with a mounting kit fitted, it can be ordered from the supplier of the drive. Refer to Table 2-4 on page 14.

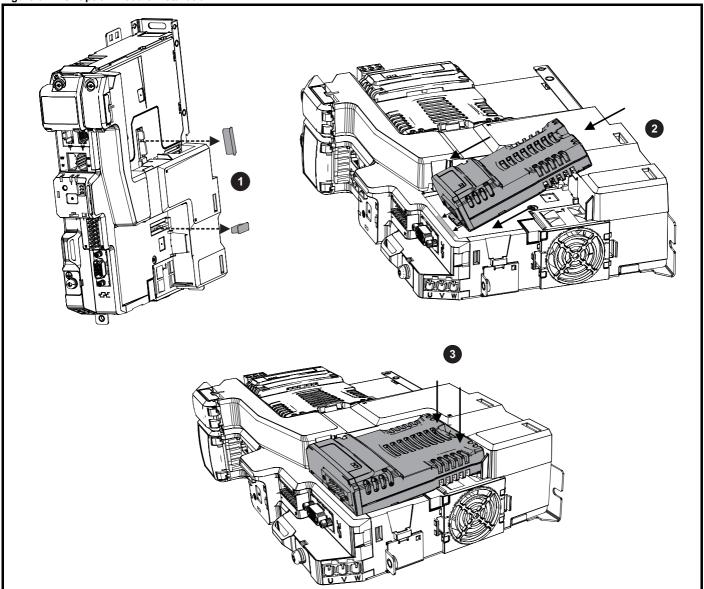

For fitting instructions, refer to Figure 3-1.

- 1a. Insert a flat head terminal screwdriver underneath the option module slot covers and prise both out in the direction shown as highlighted (1b).
- 2. Install the interface card into the option module slot (do not remove the protective cover). The interface card will remain at an angle with respect to the plastic.
- **3.** Line up and clip the SI-option module support mounting frame to the drive in the direction shown.

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Ontimization	SD Card	Onboard	Advanced	Diagnostics	UL listing
information	information	installation	installation	started	parameters	the motor	Optimization	Operation	PLC	parameters	Diagnostics	information

Figure 3-2 SI-Option module installation

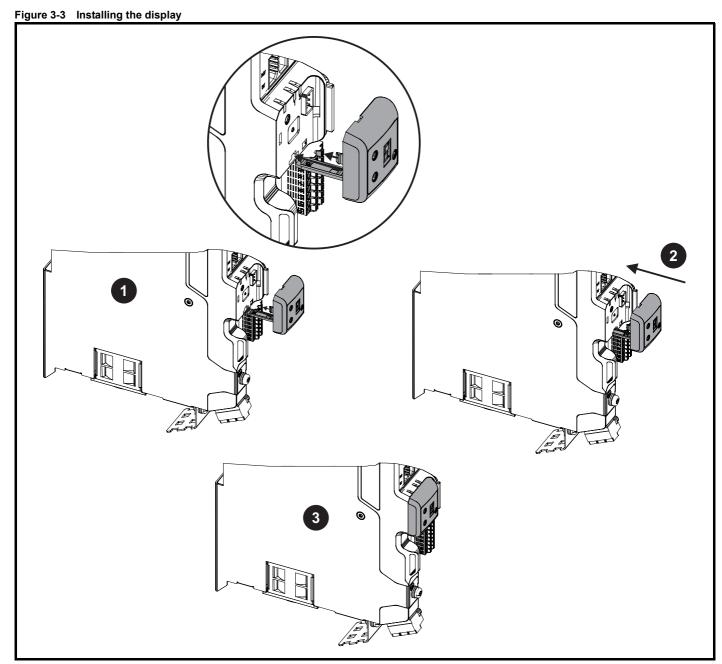

- 1. Remove the protective interface card cover.
- 2. Align and insert the option module tab into the slot on the drive plastic.
- 3. Once the option module tab is located into the slot on the drive, push down at the rear of the option module until it clicks into place.

NOTE

Once fitted, the SI-option module remains at an angle with respect to the drive.

information	information	installation	installation	started	parameters	the motor	Optimization	Operation	PLC	parameters	Diagnostics	information

3.2 KI-Compact Display installation

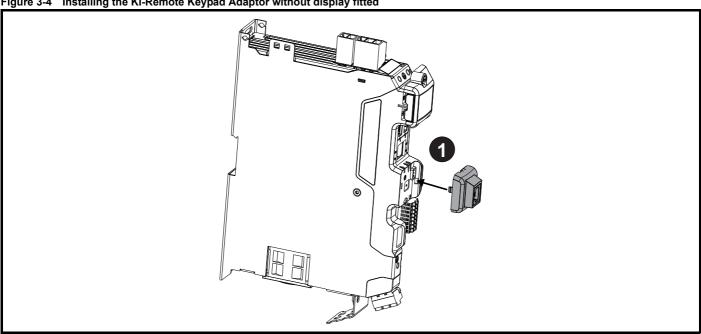

- 1. Align display tether with slot.
- 2. Slide the display and tether in the direction shown.
- 3. Push display until it clicks into position.

Safety Product Electrical Getting Basic Running SD Card Onboard Advanced **UL** listing Diagnostics Optimization information Operation PLC parameters

3.3 KI-Remote Keypad Adaptor installation

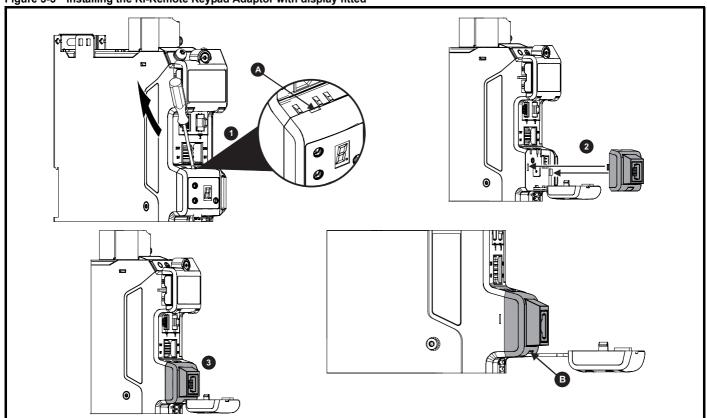

The M75X Remote Keypad Adaptor provides an EIA-485 port for permanent connection to a KI-Remote Keypad or the temporary attachment for PC tool connection. The KI-Remote Keypad Adaptor is available from the supplier of the drive. Refer to Table 2-4 Additional options on page 14.

Figure 3-4 Installing the KI-Remote Keypad Adaptor without display fitted

1. Align the KI-Remote Keypad Adaptor to the display housing and push on until it clicks into place.

Figure 3-5 Installing the KI-Remote Keypad Adaptor with display fitted

- Unclip and pull the display away from the front cover. The tether keeps the display associated to the drive and should not be removed. A small terminal screwdriver maybe required to unclip the display. A slot in the drive plastic is provided for this purpose (A).
- Align the Remote Keypad Adaptor with the display housing noting the position of the notch (See view B above). Install the Remote Keypad Adaptor over the display tether.
- 3. Push the Remote Keypad Adaptor into the housing until it clicks into place.

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Optimization	SD Card	Onboard	Advanced	Diagnostics	UL listing

4 Electrical installation

4.1 External 24 Vdc supply

The drive will power down and reset if the external 24 Vdc is removed.

An external 24 Vdc supply is required to power all the low voltage circuits within the drive.

The cable length between the 24 Vdc power supply and the drive should not exceed 10 m.

The 0V connection of the external 24 Vdc power supply should be connected to the same ground connection as the drive. Where this is not possible the 0V connection of the 24 Vdc power supply should be floating.

The working voltage range of the drive 24 V power circuit is as follows:

Table 4-1 Working voltage range of the 24 Vdc supply

1	0V common						
2	2 +24 Vdc						
All fram	ne sizes						
Nomina	l operating voltage	24.0 Vdc					
Minimur	n continuous operating voltage	20.4 V					
Maximu	m continuous operating voltage	28.8 V					
Minimur	n start up voltage	20.4 V					
Maximu	m fuse rating	30 A					

Table 4-2 24 Vdc typical input current and power requirements

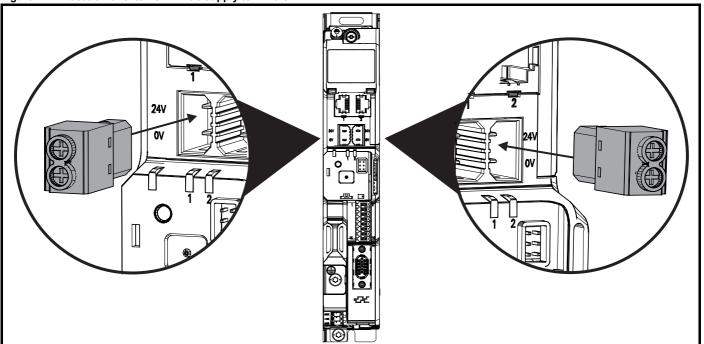

Model / Option / Feature	Frame size	Typical input current (mA) @ 24 V	Typical input power (W)
Digitax HD M75X drive module	1, 2	894	21.5
Digitax HD M75A drive module	3	1039	25
SI-option module	Per module	450	11
High current brake output	All	1200	28.8
KI-Compact display	All	10	0.24
KI-Remote LCD keypad	All	73	1.75

NOTE

During start up of the external 24 Vdc supply, allow for an additional 1 A for 300 ms.

	Uptimization			Diagnostics	
information information installation installation started parameters t	the motor	Operation F	PLC parameters	g	information

Figure 4-1 Location of external 24 Vdc supply terminals

NOTE

The 24 Vdc supply connector has been designed to allow wiring from either the left or right hand side of the drive. The same plug should be used but attention is required to the polarity of the wiring. If it is reversed, the drive will not power up but will not be damaged.

For stand alone drives connection to either terminal is permissible.

4.2 Low voltage operation

The drive is able to operate from a low voltage DC supply with a range from 24 Vdc to the maximum DC volts. It is possible for the drive to go from operating on a normal line power supply voltage to operating on a much lower supply voltage without interruption.

Going from low voltage operation to normal mains operation requires the inrush current to be controlled. This may be provided externally. If not, the drive supply can be interrupted to utilise the normal soft starting method in the drive.

To fully exploit the new low voltage mode of operation, the under voltage trip level is now user programmable. For application data, contact the supplier of the drive.

The working voltage range of the low voltage DC power supply is as follows:

Minimum continuous operating voltage: 26 Vdc Minimum start up voltage: 32 Vdc

Maximum over voltage trip threshold: 230 Vac drives: 415 Vdc

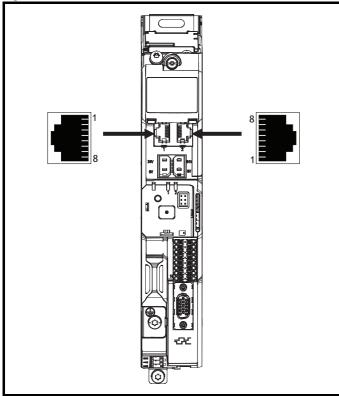

400 Vac drives: 830 Vdc

Safety Product Mechanical Basic Running SD Card Advanced **UL** listing Onboard Electrical Optimization Diagnostics informatio installation the moto Operation PLC parameters

4.3 Communication connections

The Digitax HD M751 drive offers a 2 wire EIA-485 interface. This enables the drive set-up, operation and monitoring to be carried out with a PC or controller if required.

Figure 4-2 Location of the communication connectors

4.3.1 Digitax HD M751 EIA-485 serial communications

The EIA-485 interface provides two parallel RJ45 connectors allowing easy daisy chaining, refer to Figure 4-2 Location of the communication connectors. The drive only supports Modbus RTU protocol. See Table 4-3 for the connection details.

Standard Ethernet cables are not recommended for use when connecting drives on a EIA-485 network as they do not have the correct twisted pairs for the pinout of the serial comms port.

If an Ethernet network adaptor is inadvertently connected to a Digitax HD M751 EIA-485 drive, a low impedance load across the EIA-485 24 V is applied and if connected for a significant period of time can introduce the potential risk of damage.

Table 4-3 Serial communication port pin-outs

Pin	Function
1	120 Ω Termination resistor
2	RX TX
3	Isolated 0V
4	+24 V (100 mA) output
5	Isolated 0V
6	TX enable
7	RX\ TX\
8	RX\ TX\ (if termination resistors are required, link to pin 1)
Shell	Isolated 0V

Minimum number of connections are 2, 3, 7 and shield.

4.3.2 Digitax HD M751 Isolation of the EIA-485 serial communications port

The serial communications port is double insulated from the high voltage drive circuits and meets the requirements for PELV (Protective Extra Low Voltage) according to IEC61800-5-1. The communications ports remain referenced to other PELV rated circuits within the drive (including the control, feedback and digital I/O). Where further isolation from these PELV rated circuits is required and additional external isolation barrier will be required.

In order to meet the requirements for SELV in IEC60950 (IT equipment) it is necessary for the control computer to be grounded. Alternatively, when a lap-top or similar device is used which has no provision for grounding, an isolation WARNING device must be incorporated in the communications lead.

An isolated serial communications lead has been designed to connect the drive to IT equipment (such as laptop computers), and is available from the supplier of the drive. See below for details:

Table 4-4 Isolated serial comms lead details

Part number	Description
4500-0096	CT USB Comms cable

The "isolated serial communications" lead has reinforced insulation as defined in IEC60950 for altitudes up to 3,000 m.

4.3.3 Communication networks and cabling

Any isolated signal circuit has the capability to become live through accidental contact with other conductors; as such they should always be double-insulated from live parts. The routing of network and signal wires should be done so as to avoid close proximity to mains voltage cabling.

4.4 Control connections

4.4.1 Digitax HD M75X control connections

Table 4-5 The control connections consist of:

Function	Qty	Control parameters available	Terminal number
Differential analog input	1	Offset, invert, scaling	9, 10
Digital input	2	Destination, invert, logic select	11, 13
Digital output	2	Source, invert, logic select	14, 16
Drive enable (Safe Torque Off)	2		2, 6
+24 V User output	1	Source, invert	12
0V common	7		1, 3, 4, 5, 7, 8, 15

Key:

Destination parameter:	Indicates the parameter which is being controlled by the terminal / function
Source parameter:	Indicates the parameter being output by the terminal

All analog terminal functions can be programmed in menu 7. All digital terminal functions can be programmed in menu 8.

The control circuits are isolated from the power circuits in the drive by basic insulation (single insulation) only. The installer must ensure that the external control circuits are insulated from human contact by at least one layer of insulation (supplementary insulation) rated for use at the AC supply

Safety Product Mechanical Getting Basic Running SD Card Onboard Advanced **UL** listing Electrical Optimization Diagnostics parameters information information installation started the moto Operation PLC parameters information

If the control circuits are to be connected to other circuits classified as Safety Extra Low Voltage (SELV) (e.g. to a personal computer), an additional isolating barrier must be included in order to maintain the SELV classification.

If any of the digital inputs (including the drive enable input) are connected in parallel with an inductive load (i.e. contactor or motor brake) then suitable suppression (i.e. diode or varistor) should be used on the coil of the load. If no suppression is used then over voltage spikes can cause damage to the digital inputs and outputs on the drive.

NOTE

Any signal cables which are carried inside the motor cable (i.e. motor thermistor, motor brake) will pick up large pulse currents via the cable capacitance. The shield of these signal cables must be connected to ground close to the point of exit of the motor cable, to avoid this noise current spreading through the control system.

NOTE

The Safe Torque Off drive enable terminal is a positive logic input only. It is not affected by the setting of *Input Logic Polarity* (08.029).

NOTE

The control circuits are isolated from the power circuits in the drive by reinforced insulation.

The Safe Torque Off function may be used in a safety-related application in preventing the drive from generating torque in the motor to a high level of integrity. The system designer is responsible for ensuring that the complete system is safe and designed correctly according to the relevant safety standards. If the Safe Torque Off function is not required, these terminals are used for enabling the drive.

Refer to section 4.6 Safe Torque Off (STO) on page 30 for further information.

4.5 Position feedback connections

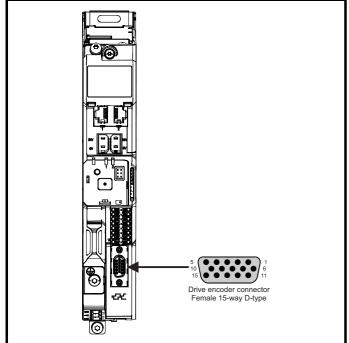

The following functions are provided via the 15-way high density D-type connector on the drive:

- · Two position feedback interfaces (P1 and P2).
- One encoder simulation output.
- · Two freeze trigger inputs (marker inputs).
- · One thermistor input.

The P1 position interface is always available but the availability of the P2 position interface and the encoder simulation output depends on the position feedback device used on the P1 position interface, as shown in Table 4-8.

4.5.1 Location of position feedback connector

EnDat	AB, FD, FR EnDat, SSI (with freeze input), BiSS	None
SSI BiSS	None	Full
5.00	EnDat, SSI, BiSS	No Z marker pulse output

The priority of the position feedback interfaces and the encoder simulation output on the 15-way D-type is assigned in the following order from the highest priority to the lowest.

- P1 position interface (highest)
- Encoder simulation output
- P2 position interface (lowest)

For example, if an AB Servo type position feedback device is selected for use on the P1 position interface, then both the encoder simulation output and the P2 position interface will not be available as this device uses all connections of the 15-way D-type connector. Also, if an AB type position feedback device is selected for use on the P1 position interface and Pr 03.085 is set to a valid source for the encoder simulation output, then the P2 position interface will not be available.

Depending on the device type used on the P1 position interface, the encoder simulation output may not be able support a marker pulse output (e.g. SC EnDat or SC SSI device types). Pr **03.086** shows the status of the encoder simulation output indicating whether the output is disabled, no marker pulse is available or full encoder simulation is available.

NOTE

When using the P1 and P2 position interfaces and the encoder simulation output together, the P2 position interface uses alternative connections on the 15-way D-type connector. Pr **03.172** shows the status of the P2 position interface and indicates if alternative connections are being used for the P2 position interface.

 $^{^{\}star 1}$ The encoder simulation output is disabled when Pr ${\bf 03.085}$ is set to zero.

NOTE

The termination resistors are always enabled on the P2 position interface. Wire break detection is not available when using AB, FD or FR position feedback device types on the P2 position interface.

Common to all Feedback types

13	Feedback device supply						
Supply	y voltage	5.15 V ±2 %, 8 V ±5 % or 15 V ±5 %					
Maximum output current		300 mA for 5 V and 8 V 200 mA for 15 V					

The voltage on Terminal 13 is controlled by Pr 03.036. The default for this parameter is 5 V (0) but this can be set to 8 V (1) or 15 V (2). Setting the encoder voltage too high for the encoder could result in damage to the feedback device. The termination resistors should be disabled if the outputs from the encoder are higher than 5 V.

14 0V Common

Motor thermistor input

Thermistor type is selected in P1 Thermistor Type (03.118).

Sincos encoder resolution

The sine wave frequency can be up to 500 kHz but the resolution is reduced at high frequency. Table 4-11 shows the number of bits of interpolated information at different frequencies and with different voltage levels at the drive encoder port. The total resolution in bits per revolution is the ELPR plus the number of bits of interpolated information. Although it is possible to obtain 11 bits of interpolation information, the nominal design value is 10 bits.

Table 4-11 Feedback resolution based on frequency and voltage

Volt/Freq	1 kHz	5 kHz	50 kHz	100 kHz	200 kHz	500 kHz
1.2	11	11	10	10	9	8
1.0	11	11	10	9	9	7
8.0	10	10	10	9	8	7
0.6	10	10	9	9	8	7
0.4	9	9	9	8	7	6

4.6 Safe Torque Off (STO)

The Safe Torque Off function provides a means for preventing the drive from generating torque in the motor, with a very high level of integrity. It is suitable for incorporation into a safety system for a machine. It is also suitable for use as a conventional drive enable input.

The safety function is active when the STO input is in the logic-low state as specified in the control terminal specification. The function is defined according to EN 61800-5-2 and IEC 61800-5-2 as follows. (In these standards a drive offering safety-related functions is referred to as a PDS(SR)):

'Power that can cause rotation (or motion in the case of a linear motor) is not applied to the motor. The PDS(SR) will not provide energy to the motor which can generate torque (or force in the case of a linear motor)'

This safety function corresponds to an uncontrolled stop in accordance with stop category 0 of IEC 60204-1.

The Safe Torque Off function makes use of the special property of an inverter drive with an induction motor, which is that torque cannot be generated without the continuous correct active behaviour of the inverter circuit. All credible faults in the inverter power circuit cause a loss of torque generation.

Note on the use of servo motors, other permanent-magnet motors, reluctance motors and salient-pole induction motors:

When the drive is disabled through Safe Torque Off, a possible (although highly unlikely) failure mode is for two power devices in the inverter circuit to conduct incorrectly.

This fault cannot produce a steady rotating torque in any AC motor. It produces no torque in a conventional induction motor with a cage rotor.

If the rotor has permanent magnets and/or saliency, then a transient alignment torque may occur. The motor may briefly try to rotate by up to 180° electrical, for a permanent magnet motor, or 90° electrical, for a salient pole induction motor or reluctance motor. This possible failure mode must be allowed for in the machine design.

The Safe Torque Off function is fail-safe, so when the Safe Torque Off input is disconnected the drive will not operate the motor, even if a combination of components within the drive has failed. Most component failures are revealed by the drive failing to operate. Safe Torque Off is also independent of the drive firmware. This meets the requirements of the following standards, for the prevention of operation of the motor.

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Optimization	SD Card	Onboard	Advanced	Diagnostics	UL listing
information	information	installation	installation	started	parameters	the motor	Optimization	Operation	PLC	parameters	Diagnostics	information

Machinery Applications

The Safe Torque Off function is suitable for use as a safety component of a machine:

Safety Parameters

According to IEC 61508-1 to 7 / EN 61800-5-2 / EN 62061

Туре	Value	Percentage of SIL 3 allowance					
Proof test interval	20 years						
High demand or a continuous mode of operation							
PFH (1/h)	4.21 x 10 ⁻¹¹ 1/h	<1 %					
Low demand mode of operation (not EN 61800-5-2)							
PFDavg	3.68 x 10 ⁻⁶	< 1 %					

According to EN ISO 13849-1

Туре	Value	Classification
Category	4	
Performance Level (PL)	е	
MTTF _D (STO1)	>2500 years	High
MTTF _D (STO2)	>2500 years	High
MTTFD (Single channel STO)	>2500 years	High
DC _{avg}	≥99 %	High
Mission time	20 years	

NOTE

Logic levels comply with IEC 61131-2:2007 for type 1 digital inputs rated at 24 V. Maximum level for logic low to achieve SIL3 and PL e 5 V and 0.5~mA

Two-channel Safe Torque Off

The Digitax HD M75X series has dual channel Safe Torque Off.

The dual channel STO has two fully independent channels.

Each input meets the requirements of the standards as defined above.

If either or both inputs are set at a logic low state, there are no single faults in the drive which can permit the motor to be driven.

It is not necessary to use both channels to meet the requirements of the standards. The purpose of the two channels is to allow connection to machine safety systems where two channels are required, and to facilitate protection against wiring faults.

For example, if each channel is connected to a safety-related digital output of a safety related controller, computer or PLC, then on detection of a fault in one output the drive can still be disabled safely through the other output.

Under these conditions, there are no single wiring faults which can cause a loss of the safety function, i.e. inadvertent enabling of the drive.

In the event that the two-channel operation is not required, the two inputs can be connected together to form a single Safe Torque Off input.

One-channel Safe Torque Off (Including Two- channel Safe Torque off with the inputs connected together).

In a single channel Safe torque Off application there are no single faults in the drive which can permit the motor to be driven. Therefore it is not necessary to have a second channel to interrupt the power connection, nor a fault detection circuit.

It is important to note that a single short-circuit from the Safe Torque Off input to a DC supply of > 5V could cause the drive to be enabled.

This might occur through a fault in the wiring. This can be excluded according to EN ISO 13849-2 by the use of protected wiring. The wiring can be protected by either of the following methods:

By placing the wiring in a segregated cable duct or other enclosure.

or

By providing the wiring with a grounded (0V of the Drive) shield in a
positive-logic grounded control circuit. The shield is provided to
avoid a hazard from an electrical fault. It may be grounded by any
convenient method; no special EMC precautions are required.

Note on response time of Safe Torque Off, and use with safety controllers with self-testing outputs:

Safe Torque Off has been designed to have a response time of greater than 1 ms so that it is compatible with safety controllers whose outputs are subject to a dynamic test with a pulse width not exceeding 1 ms.

The design of safety-related control systems must only be done by personnel with the required training and experience. The Safe Torque Off function will only ensure the safety of a machine if it is correctly incorporated into a complete safety system. The system must be subject to a risk assessment to confirm that the residual risk of an unsafe event is at an acceptable level for the application.

Safe Torque Off inhibits the operation of the drive, this includes inhibiting braking. If the drive is required to provide both braking and Safe Torque Off in the same operation (e.g. for emergency stop) then a safety timer relay or similar device must be used to ensure that the drive is disabled a suitable time after braking. The braking function in the drive is provided by an electronic circuit which is not fail-safe. If braking is a safety requirement, it must be supplemented by an independent fail-safe braking mechanism.

Safe Torque Off does not provide electrical isolation. The supply to the drive must be disconnected by an approved isolation device before gaining access to power connections.

It is essential to observe the maximum permitted voltage of 5 V for a safe low (disabled) state of Safe Torque Off. The connections to the drive must be arranged so that voltage drops in the 0 V wiring cannot exceed this value under any loading condition. It is strongly recommended that the Safe Torque Off circuit be provided with a dedicated 0 V conductor which should be connected to either terminals 1, 3, 4, 5, 7 or 15 at the drive.

Safe Torque Off over-ride

The drive does not provide any facility to over-ride the Safe Torque Off function, for example for maintenance purposes.

Lift (Elevator) Applications

The Safe Torque Off function is suitable for use as a safety component in lift (elevator) applications:

The Safe Torque Off function can be used to eliminate electromechanical contactors, including special safety contactors, which would otherwise be required for safety applications.

For further information, contact the supplier of the drive.

Safety Product Mechanical Electrical Basic Running SD Card Onboard Advanced **UL** listing Optimization Diagnostics informatior installation parameters the moto Operation parameters

5 Getting started

This chapter introduces the user interfaces, menu structure and security levels of the drive.

5.1 Display and Keypad operation

The drive can be directly fitted with a KI-Compact Display.

A Remote-Keypad RTC connected to the drive either via a KI-Remote keypad adaptor or one of the drive's RS485 ports (M751 only) and a suitable Cat 5E patch cord.

5.1.1 KI-Compact Display

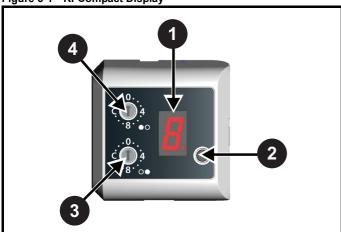

The M75X display provides the following features:

- · Displays drive status information.
- Allows the drive node address to be set via dials on the front of the display.
- A push button to reset drive trips.

If not already fitted, the display can be ordered from the supplier of the drive. Refer to Table 2-3 *Display / Keypad identification* on page 13.

5.1.2 Drive state representation

Figure 5-1 KI-Compact Display

- 1. Single Character display.
- 2. Reset switch.
- 3. Rotary dial for node address setting (least significant).
- 4. Rotary dial for node address setting (Most significant).

The display provides the following drive status information:

A single character code is used to indicate non tripped drive states as a non flashing display, refer to Table 5-1 for further information.

Table 5-1 Single character status indication codes (non tripped drive state)

Display	Drive status		Drive output		
character	LED	Description	stage		
n	Non flashing (RED)	Inhibit state	Disabled		
	Flashing (RED)	Communications to drive lost for > 10 seconds	N/A		
,	Non flashing (RED)	Ready state	Disabled		
Ħ	Non flashing (RED)	Under the following status indicators: Stop Scan Run Supply Loss Deceleration DC injection Position Active Heat Phasing	Enabled		
	Non flashing (RED)	Under voltage	Disabled		

The decimal point on the display is used to alert the user of the following situations:

- The SD card is being accessed.
 - The decimal point on the display will be illuminated constantly whenever the drive is accessing the SD card.
- · The drive has an active alarm.
 - The decimal point will flash if the drive has an active alarm.

5.1.3 Node address setting

The KI-Compact Display rotary dials allow for the drive node address to be configured from 0 to 247.

The most significant nibble is set by adjusting the top dial and least significant nibble is set by the bottom dial (see Figure 5-1 *KI-Compact Display*).

Dial settings and equivalent decimal values are shown in Figure 5-2.

Safetv	Product	Mechanical	Electrical	Gettina	Basic	Runnina		SD Card	Onboard	Advanced		UL listina

Table 5-2 Dial settings and equivalent decimal value

Most signif	icant nibble	Least signif	icant nibble		
Dial setting	Decimal value	Dial setting	Decimal value		
1	16	1	1		
2	32	2	2		
3	48	3	3		
4	64	4	4		
5	80	5			
6	96	6	6		
7	112	7	7		
8	128 8		8		
9	144	9	9		
Α	160	Α	10		
В	176	В	11		
С	192	С	12		
D	208	D	13		
E	224	Е	14		
F	240	F	15		

The node address will be set to the sum of the most significant nibble and the least significant nibble (in decimal).

As the dials are adjusted each setting is shown on the display. Once the dials are set to the desired configurations the display will confirm the dial settings in hexadecimal followed by the node address setting in decimal, dial settings and node address are separated with a hyphen (-). Serial address (Pr 11.023) and Keypad defined node address (Pr 11.017) are then updated.

Example:

To set a node address of 55 via the display, with reference to table 5-2, set the most significant dial to 3 (decimal 48) and the least significant dial to 7 (decimal 7).

NOTE

The node address setting can be configured from the rotary dials of the KI-Compact Display with no power applied to the drive (with the exception of a zero value setting). Non zero configured settings will be transferred to the drive on the next power up.

NOTE

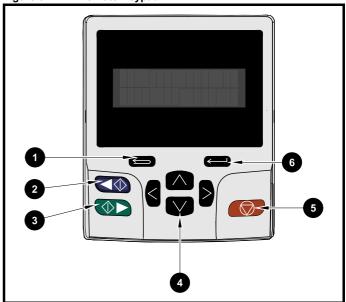

The KI-Compact Display can be installed/removed while the drive is powered. A delay of 10 seconds should be maintained following power up or following a node address dial adjustment before the KI-Compact Display can be removed from the drive, to ensure correct transfer of node address data.

5.1.4 KI-Remote Keypad RTC

The KI-Remote Keypad RTC display consists of two rows of text. The upper row shows the drive status or the menu and parameter number currently being viewed. The lower row of the display line shows the parameter value or the specific trip type. The last two characters on the first row may display special indications. If more than one of these indications is active then the indications are prioritized as shown in Table 5-4.

When the drive is powered up the lower row will show the power up parameter defined by *Parameter Displayed At Power-Up* (11.022).

Figure 5-2 KI-Remote Keypad RTC

- 1. Escape button
- 2. Start reverse (Auxiliary button)
- Start forward
- Navigation keys (x4)
- 5. Stop / Reset (red) button
- 6. Enter button

NOTE

The red stop button is also used to reset the drive.

The parameter value is correctly displayed in the lower row of the keypad display, see table below.

5.2 KI-Remote Keypad operation

5.2.1 Control buttons

The keypad consists of:

- Navigation Keys Used to navigate the parameter structure and change parameter values.
- Enter / Mode button Used to toggle between parameter edit and view mode.
- Escape / Exit button Used to exit from parameter edit or view mode. In parameter edit mode, if parameter values are edited and the exit button pressed the parameter value will be restored to the value it had on entry to edit mode.
- Start forward button Use to provide a 'Run' command if keypad mode is selected.
- Start reverse button Used to control the drive if keypad mode is selected and the reverse button is activated. If Enable Auxiliary Key (06.013) = 1, then the keypad reference is toggled between run forward and run reverse each time the button is pressed. If Enable Auxiliary Key (06.013) = 2, then the button functions as a run reverse key.
- Stop / Reset button Used to reset the drive. In keypad mode can be used for 'Stop'.

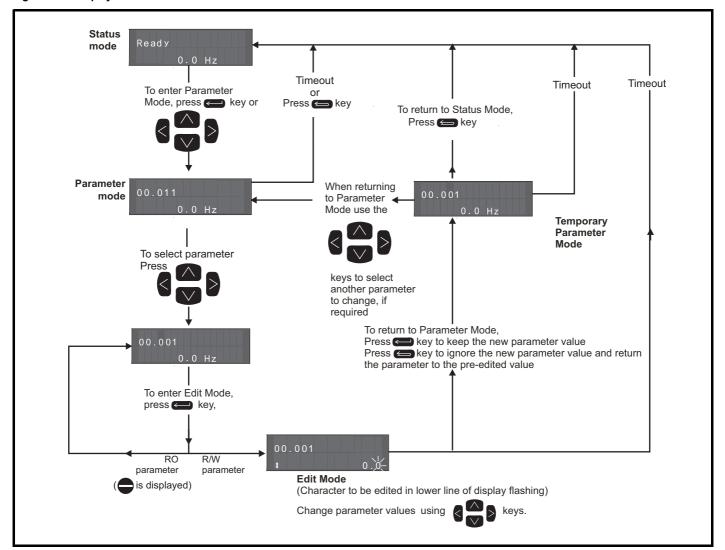

NOTE

Low battery voltage is indicated by \Box low battery symbol on the keypad display.

Figure 5-3 overleaf shows an example on moving between menus and editing parameters.

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Ontimization	SD Card	Onboard	Advanced	Diagnostics	UL listing

Figure 5-3 Display modes

NOTE

The navigation keys can only be used to move between menus if Pr **00.049** has been set to show 'All Menus'. Refer to section 5.9 *Parameter access level and security* on page 39.

5.2.2 Quick access mode

The quick access mode allows direct access to any parameter without scrolling through menus and parameters.

To enter the quick access mode, press and hold the Enter button on the keypad while in 'parameter mode'.

Figure 5-4 Quick access mode

5.2.3 KI-Remote Keypad shortcuts In 'parameter mode':

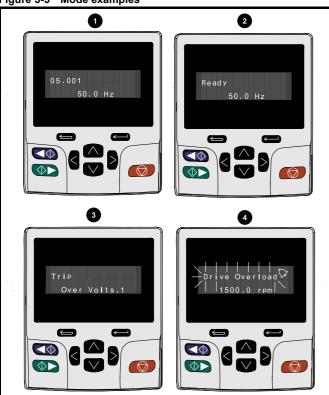

- If the up and down keypad buttons are pressed together, then the keypad display will jump to the start of the parameter menu being viewed, i.e. Pr 05.005 being viewed, when the above buttons pressed together will jump to Pr 05.000.
- If the left and right keypad buttons are pressed together, then the keypad display will jump to the last viewed parameter in Menu 0.

In 'parameter edit mode':

- If the up and down keypad buttons are pressed together, then the parameter value of the parameter being edited will be set to 0.
- If the least significant digit (furthest right) will be selected on the keypad display for editing.

Safety Product Mechanical Electrical Basic Running SD Card Onboard Advanced **UL** listing Optimization Diagnostics information information installation installation started parameters the moto parameters

Figure 5-5 Mode examples

1. Parameter view mode: Read write or Read only

2. Status mode: Drive OK status

If the drive is ok and the parameters are not being edited or viewed, the upper row of the display will show one of the following:

· 'Inhibit', 'Ready' or 'Run'.

3. Status mode: Trip status

When the drive is in trip condition, the upper row of the display will indicate that the drive has tripped and the lower row of the display will show the trip code. For further information regarding trip codes. refer to Table 12-4 *Trip indications* on page 195.

4. Status mode: Alarm status

During an 'alarm' condition the upper row of the display flashes between the drive status (Inhibit, Ready or Run, depending on what is displayed) and the alarm.

Do not change parameter values without careful consideration; incorrect values may cause damage or a safety hazard.

NOTE

When changing the values of parameters, make a note of the new values in case they need to be entered again.

NOTE

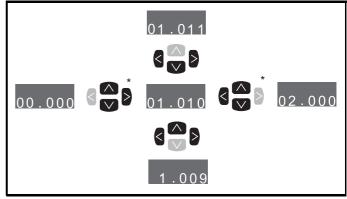

For new parameter-values to apply after the line power supply to the drive is interrupted, new values must be saved. Refer to section 5.7 *KI-Remote Keypad saving parameters* on page 39.

5.3 Menu structure

The drive parameter structure consists of menus and parameters.

The drive initially powers up so that only Menu 0 can be viewed. The up and down arrow buttons are used to navigate between parameters and once Pr **00.049** has been set to 'All Menus' the left and right buttons are used to navigate between menus. For further information, refer to section 5.9 *Parameter access level and security* on page 39.

Figure 5-6 Parameter navigation

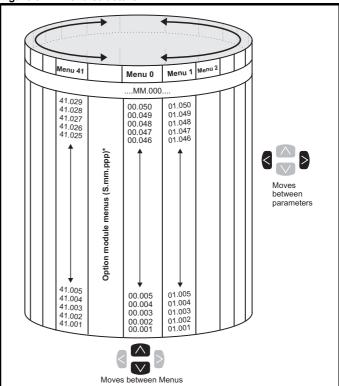

* Can only be used to move between menus if all menus have been enabled (Pr **00.049**). Refer to section 5.9 *Parameter access level and security* on page 39.

The menus and parameters roll over in both directions.

i.e. if the last parameter is displayed, a further press will cause the display to rollover and show the first parameter.

When changing between menus the drive remembers which parameter was last viewed in a particular menu and thus displays that parameter.

Figure 5-7 Menu structure

^{*} The option module menus (S.mm.ppp) are only displayed if option modules are installed. Where S signifies the option module slot number and the mm.ppp signifies the menu and the parameter number of the option module's internal menus and parameter.

5.4 Menu 0

Menu 0 is used to bring together various commonly used parameters for basic easy set up of the drive. The parameters displayed in Menu 0 can be configured in Menu 22.

Appropriate parameters are copied from the advanced menus into Menu 0 and thus exist in both locations.

For further information, refer to Chapter 6 Basic parameters on page 42.

Figure 5-8 Menu 0 copying

5.5 **Advanced menus**

The advanced menus consist of groups or parameters appropriate to a specific function or feature of the drive. Menus 0 to 41 can be viewed on the Remote Keypad RTC.

The option module menus (S.mm.ppp) are only displayed if option modules are installed. Where S signifies the option module slot number and the mm.ppp signifies the menu and parameter number of the option module's internal menus and parameter.

Table 5-5 Advanced menu descriptions

NOTE

It is not possible to access the keypad parameters via any communications channel.

5.5.2 KI-Remote Keypad alarm indications

An alarm is an indication given on the display by alternating the alarm string with the drive status string on the upper row and showing the alarm symbol in the last character in the upper row. Alarms strings are not displayed when a parameter is being edited, but the user will still see the alarm character on the upper row.

Table 5-7 Alarm indications

Alarm string	Description
Brake Resistor	Brake resistor overload. <i>Braking Resistor Thermal Accumulator</i> (10.039) in the drive has reached 75.0 % of the value at which the drive will trip.
Motor Overload	Motor Protection Accumulator (04.019) in the drive has reached 75.0 % of the value at which the drive will trip and the load on the drive is > 100 %.
Ind Overload	Regen inductor overload. <i>Inductor Protection Accumulator</i> (04.019) in the drive has reached 75.0 % of the value at which the drive will trip and the load on the drive is > 100 %.
Drive Overload	Drive over temperature. <i>Percentage Of Drive Thermal Trip Level</i> (07.036) in the drive is greater than 90 %.
Auto Tune	The autotune procedure has been initialized and an autotune in progress.
Limit Switch	Limit switch active. Indicates that a limit switch is active and that is causing the motor to be stopped.

5.5.3 KI-Remote Keypad display messages

The following tables indicate the various possible mnemonics which can be displayed by the drive and their meaning.

Table 5-8 Status indications

Upper row string	Description	Drive output stage	
Inhibit	The drive is inhibited and cannot be run. The Safe Torque Off signal is not applied to Safe Torque Off terminals or Pr 06.015 is set to 0. The other conditions that can prevent the drive from enabling are shown as bits in <i>Enable Conditions</i> (06.010).	Disabled	
Ready	Ready The drive is ready to run. The drive enable is active, but the drive inverter is not active because the final drive run is not active.		
Stop	The drive is stopped / holding zero speed.	Enabled	
Run	The drive is active and running.	Enabled	
Scan	The drive is enabled in Regen mode and is trying to synchronize to the supply.	Enabled	
Supply Loss	Supply loss condition has been detected.	Enabled	
Deceleration	The motor is being decelerated to zero speed / frequency because the final drive run has been deactivated.	Enabled	
dc injection	The drive is applying dc injection braking.	Enabled	
Position	Positioning / position control is active during an orientation stop.	Enabled	
Trip	The drive has tripped and no longer controlling the motor. The trip code appears in the lower display.	Disabled	
Active	The Regen unit is enabled and synchronized to the supply.	Enabled	
Under Voltage	The drive is in the under voltage state either in low voltage or high voltage mode.	Disabled	
Heat	The motor pre-heat function is active.	Enabled	
Phasing	The drive is performing a 'phasing test on enable'.	Enabled

Table 5-9 Option module and SD card and other status indications at power-up

First row string	Second row string	Status					
Booting	Parameters	Parameters are being loaded					
Drive parameters are being loaded from an SD Card.							
Booting User Program User program being loaded							
User program is being loaded from an SD Card to the drive.							
Booting Option Program		User program being loaded					
User program is being loaded from an SD Card to the option module in slot X.							
Writing To	NV Card	Data being written to SD Card					
Data is being written to an SD Card to ensure that its copy of the drive							

parameters is correct because the drive is in Auto or Boot mode.

Waiting For Power System Waiting for power stage

The drive is waiting for the processor in the power stage to respond after power-up.

Waiting For Options Waiting for an option module

The drive is waiting for the options modules to respond after power-up.

Uploading From Options Loading parameter database

At power-up it may be necessary to update the parameter database held by the drive because an option module has changed or because an applications module has requested changes to the parameter structure. This may involve data transfer between the drive an option modules. During this period 'Uploading From Options' is displayed.

5.6 KI-Remote Keypad changing the operating mode

Changing the operating mode returns all parameters to their default value, including the motor parameters. *User security status* (00.049) and *User security code* (00.034) are not affected by this procedure).

Procedure

Use the following procedure only if a different operating mode is required:

- Ensure the drive is not enabled, i.e. terminals 2 and 6 are open or Pr 06.015 is Off (0)
- Enter either of the following values in Pr mm.000, as appropriate: 1253 (50 Hz AC supply frequency) 1254 (60 Hz AC supply frequency)
- 3. Change the setting of Pr 0.048 as follows:

Pr 00.048 setting	Operating mode	
00.048 t Open-loop	1	Open-loop
00.048 t RFC-A	2	RFC-A
00.048 t RFC-S	3	RFC-S

The figures in the second column apply when serial communications are

- 4. Either:
- Press the red reset button
- · Toggle the reset digital input
- Carry out a drive reset through serial communications by setting Pr 10.038 to 100.

NOTE

Entering 1253 or 1254 in Pr mm.000 will only load defaults if the setting of Pr 00.048 has been changed.

5.7 KI-Remote Keypad saving parameters

When changing a parameter in Menu 0, the new value is saved when pressing the Enter button to return to parameter view mode from parameter edit mode.

If parameters have been changed in the advanced menus, then the change will not be saved automatically. A save function must be carried out

Procedure

- Select 'Save Parameters' in Pr mm.000 (alternatively enter a value of 1001 in Pr mm.000)
- Either:
- Press the red reset button
- · Toggle the reset digital input, or
- Carry out a drive reset through serial communications by setting Pr 10.038 to 100

5.8 Restoring parameter defaults

Restoring parameter defaults by this method saves the default values in the drives memory. *User security status* (00.049) and *User security code* (00.034) are not affected by this procedure).

Procedure

- 1. Ensure the drive is not enabled, i.e. terminal 2 and 6 are open or Pr **06.015** is Off (0)
- Select 'Reset 50 Hz Defs' or 'Reset 60 Hz Defs' in Pr mm.000. (alternatively, enter 1233 (50 Hz settings) or 1244 (60 Hz settings) in Pr mm.000).
- 3. Either:
- Press the red reset button on the KI-Compact Display or KI-Remote Keypad.
- Toggle the reset digital input.
- Carry out a drive reset through serial communications by setting Pr 10.038 to 100

5.9 Parameter access level and security

The parameter access level determines whether the user has access to Menu 0 only or to all the advanced menus (Menus 1 to 41) in addition to Menu 0.

The User Security determines whether the access to the user is read only or read write.

Both the User Security and Parameter Access Level can operate independently of each other as shown in Table 5-10.

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Ontimization	SD Card	Onboard	Advanced	Diagnostics	UL listing
information	information	installation	installation	started	parameters	the motor	Optimization	Operation	PLC	parameters	Diagnostics	information

Table 5-10 Parameter access level and security

User security status (00.049)	Access level	User security (00.034)	Menu 0 status	Advanced menu status
0	Menu 0	None	RW	Not visible
1	All Menus	None	RW	RW
2	Read-only	Open	RW	Not visible
2	Menu 0	Closed	RO	Not visible
3	Bood only	Open	RW	RW
3	Read-only	Closed	RO	RO
4	Status only	Open	RW	RW
4	Status only	Closed	Not visible	Not visible
5	No access	Open	RW	RW
3	INU access	Closed	Not visible	Not visible

The default settings of the drive are Parameter Access Level Menu 0 and user Security Open i.e. read / write access to Menu 0 with the advanced menus not visible.

5.9.1 User Security Level / Access Level

The drive provides a number of different levels of security that can be set by the user via *User Security Status* (11.044); these are shown below.

User Security Status (Pr 00.049)	Description
Menu 0 (0)	All writable parameters are available to be edited but only parameters in Menu 0 are visible.
All menus (1)	All parameters are visible and all writable parameters are available to be edited.
Read- only Menu 0 (2)	Access is limited to Menu 0 parameters only. All parameters are read-only.
Read-only (3)	All parameters are read-only however all menus and parameters are visible.
Status only (4)	The keypad remains in status mode and no parameters can be viewed or edited.
No access (5)	The keypad remains in status mode and no parameters can be viewed or edited. Drive parameters cannot be accessed via a comms/ fieldbus interface in the drive or any option module.

5.9.2 Changing the User Security Level /Access Level

The security level is determined by the setting of Pr **00.049** or Pr **11.044**. The Security Level can be changed through the KI-Remote Keypad even if the User Security Code has been set.

5.9.3 User Security Code

The User Security Code, when set, prevents write access to any of the parameters in any menu.

Setting User Security Code

Enter a value between 1 and 2147483647 in Pr 00.034 and press the

button; the security code has now been set to this value. In order to activate the security, the Security level must be set to desired level in Pr 00.049. When the drive is reset, the security code will have been

activated and the drive returns to Menu 0 and the symbol is displayed in the right hand corner of the keypad display. The value of Pr 00.034 will return to 0 in order to hide the security code.

Unlocking User Security Code

Select a parameter that need to be edited and press the button, the upper display will now show 'Security Code'. Use the arrow buttons

to set the security code and press the button. With the correct security code entered, the display will revert to the parameter selected in edit mode.

If an incorrect security code is entered, the following message 'Incorrect security code' is displayed, then the display will revert to parameter view mode.

Disabling User Security

Unlock the previously set security code as detailed above. Set Pr 00.034

to 0 and press the button. The User Security has now been disabled, and will not have to be unlocked each time the drive is powered up to allow read / write access to the parameters.

5.10 Displaying parameters with nondefault values only

By selecting 'Show non-default' in Pr mm.000 (Alternatively, enter 12000 in Pr mm.000), the only parameters that will be visible to the user will be those containing a non-default value. This function does not require a drive reset to become active. In order to deactivate this function, return to Pr mm.000 and select 'No action' (alternatively enter a value of 0). Please note that this function can be affected by the access level enabled, refer to section 5.9 Parameter access level and security on page 39 for further information regarding access level.

5.11 Displaying destination parameters only

By selecting 'Destinations' in Pr mm.000 (Alternatively enter 12001 in Pr mm.000), the only parameters that will be visible to the user will be destination parameters. This function does not require a drive reset to become active. In order to deactivate this function, return to Pr mm.000 and select 'No action' (alternatively enter a value of 0).

Please note that this function can be affected by the access level enabled, refer to section 5.9 *Parameter access level and security* on page 39 for further information regarding access level.

5.12 Communications

The *Digitax HD M751* drive offers a 2 wire EIA-485 interface. This enables the drive set-up, operation and monitoring to be carried out with a PC or controller if required.

5.12.1 Digitax HD M751 - EIA-485 Serial communications

The EIA-485 option provides two parallel RJ45 connectors allowing easy daisy chaining. The drive only supports Modbus RTU protocol.

The serial communications port of the drive is a RJ45 socket, which is isolated from the power stage and the other control terminals (see section 4.3 *Communication connections* on page 21 for connection and isolation details).

The communications port applies a 2 unit load to the communications network.

USB/EIA-232 to EIA-485 Communications

An external USB/EIA-232 hardware interface such as a PC cannot be used directly with the 2-wire EIA-485 interface of the drive. Therefore a suitable converter is required.

As suitable USB to EIA-485 isolated converter is available from the supplier of the drive:

USB Comms cable (Part No. 4500-0096)

NOTE

When using the EIA-232 Comms cable the available baud rate is limited to 19.2 k baud

When using one of the above converters or any other suitable converter with the drive, it is recommended that no terminating resistors be connected on the network. It may be necessary to 'link out' the terminating resistor within the converter depending on which type is used. The information on how to link out the terminating resistor will normally be contained in the user information supplied with the converter.

Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	SD Card Operation	Onboard PLC	Advanced parameters	Diagnostics	UL listing information
--------------------	---------------------	-------------------------	-------------------------	-----------------	------------------	-------------------	--------------	----------------------	----------------	---------------------	-------------	------------------------

Serial communications set-up parametersThe following parameters need to be set according to the system requirements.

	Serial communications s	set-up parameters
Serial Mode (00.035)	8 2 NP (0), 8 1 NP (1), 8 1 EP (2), 8 1 OP (3), 8 2 NP M (4), 8 1 NP M (5), 8 1 EP M (6), 8 1 OP M (7), 7 2 NP (8), 7 1 NP (9), 7 1 EP (10), 7 1 OP (11), 7 2 NP M (12), 7 1 NP M (13), 7 1 OP M (15)	The drive only supports the Modbus RTU protocol and is always a slave. This parameter defines the supported data formats used by the EIA-485 comms port (if installed) on the drive. This parameter can be changed via the drive keypad, via a option module or via the comms interface itself.
Serial Baud Rate (00.036)	300 (0), 600 (1), 1200 (2), 2400 (3), 4800 (4), 9600 (5), 19200 (6), 38400 (7), 57600(8), 76800(9), 115200 (10)	This parameter can be changed via the drive keypad, via a option module or via the comms interface itself. If it is changed via the comms interface, the response to the command uses the original baud rate. The master should wait at least 20 ms before sending a new message using the new baud rate.
Serial Address (00.037)	1 to 247	This parameter defines the serial address and an addresses between 1 and 247 are permitted.
Reset Serial Communications (00.052)	0 to 1	When the above parameters are modified the changes do not have an immediate effect on the serial communication system. The new values are used after the next power up or if Reset Serial Communications is set to 1.

6 Basic parameters

Menu 0 is used to bring together various commonly used parameters for basic easy set up of the drive. All the parameters in Menu 0 appear in other menus in the drive (denoted by {...}). Menus 22 can be used to configure the parameters in Menu 0.

6.1 Parameter ranges and variable minimum / maximums

Some parameters in the drive have a variable range with a variable minimum and a variable maximum value which is dependent on one of the following:

- · The settings of other parameters
- · The drive rating
- The drive mode
- Combination of any of the above

For more information, refer to section 11.1 Parameter ranges and Variable minimum/maximums on page 109.

6.2 Menu 0: Basic parameters

6.3 Parameter descriptions

6.3.1 Pr mm.000

Pr mm.000 is available in all menus, commonly used functions are provided as text strings in Pr mm.000 shown in Table 6-1. The functions in Table 6-1 can also be selected by entering the appropriate numeric values (as shown in Table 6-2) in Pr mm.000. For example, enter 4001 in Pr mm.000 to store drive parameters on an SD Card.

Table 6-1 Commonly used functions in xx.000

Value	Equivalent value	String	Action
0	0	[No Action]	
1001	1	[Save parameters]	Save parameters under all conditions
6001	2	[Load file 1]	Load the drive parameters or user program file from SD Card file 001
4001	3	[Save to file 1]	Transfer the drive parameters to parameter file 001
6002	4	[Load file 2]	Load the drive parameters or user program file from SD Card file 002
4002	5	[Save to file 2]	Transfer the drive parameters to parameter file 002
6003	6	[Load file 3]	Load the drive parameters or user program file from SD Card file 003
4003	7	[Save to file 3]	Transfer the drive parameters to parameter file 003
12000	8	[Show non-default]	Displays parameters that are different from defaults
12001	9	[Destinations]	Displays parameters that are set
1233	10	[Reset 50Hz defs]	Load parameters with standard (50 Hz) defaults
1244	11	[Reset 60Hz defs]	Load parameters with US (60 Hz) defaults
1070	12	[Reset modules]	Reset all option modules
11001	13	[Read enc. NP P1]	Transfer electronic nameplate motor parameters to the drive from the P1 encoder
11051	14	[Read enc. NP P2]	Transfer electronic nameplate motor parameters to the drive from the P2 encoder

Table 6-2 Functions in Pr mm 000

Table 6-2	Functions in Pr mm.000
Value	Action
1000	Save parameters when <i>Under Voltage Active</i> (Pr 10.016) is not active and <i>Low Under Voltage Threshold Select</i> mode (Pr 06.067 = Off) is not active.
1001	Save parameters under all conditions
1070	Reset all option modules
1233	Load standard (50 Hz) defaults
1234	Load standard (50 Hz) defaults to all menus except option module menus (i.e 15 to 20 and 24 to 28)
1244	Load US (60 Hz) defaults
1245	Load US (60 Hz) defaults to all menus except option module menus (i.e 15 to 20 and 24 to 28)
1253	Change drive mode and load standard (50 Hz) defaults
1254	Change drive mode and load US (60 Hz) defaults
1255	Change drive mode and load standard (50 Hz) defaults except for menus 15 to 20 and 24 to 28
1256	Change drive mode and load US (60 Hz) defaults except for menus 15 to 20 and 24 to 28
1299	Reset {Stored HF} trip.
2001*	Create a boot file on a non-volatile media card based on the present drive parameters including all Menu 20 parameters
4yyy*	SD card: Transfer the drive parameters to parameter file xxx
5yyy*	SD card: Transfer the onboard user program to onboard user program file xxx
6ууу*	SD card: Load the drive parameters from parameter file xxx or the onboard user program from onboard user program file xxx
7yyy*	SD card: Erase file xxx
8yyy*	SD card: Compare the data in the drive with file xxx
9555*	SD card: Clear the warning suppression flag
9666*	SD card: Set the warning suppression flag
9777*	SD card: Clear the read-only flag
9888*	SD card: Set the read-only flag
59999	Delete onboard user program
110S0	Transfer electronic nameplate motor object parameters from the drive to an encoder connected to the drive or an option module.
110S1	Transfer electronic nameplate motor objects parameters from an encoder connected to the drive or option module to the drive parameters.
110S2	As 110S0, but for performance object 1
110S3	As 110S1, but for performance object 1
110S4	As 110S0, but for performance object 2
110S5	As 110S1, but for performance object 2
110S6	Transfer electronic nameplate motor object parameters from the drive to an encoder connected to the drive or an option module in the Unidrive SP format.
12000**	Only display parameters that are different from their default value. This action does not require a drive reset.
12001**	Only display parameters that are used to set-up destinations (i.e. DE format bit is 1). This action does not require a drive reset.
15xxx*	Transfer the user program in an option module installed in slot 1 to a non-volatile media card file xxx
16xxx*	Transfer the user program in an option module installed in slot 2 to a non-volatile media card file xxx
17xxx*	Transfer the user program in an option module installed in slot 3 to a non-volatile media card file xxx
18xxx*	Transfer the user program from file xxx in a non-volatile media card to an option module installed in slot 1.
19xxx*	Transfer the user program from file xxx in a non-volatile media card to an option module installed in slot 2.
20xxx*	Transfer the user program from file xxx in a non-volatile media card to an option module installed in slot 3.

^{*} See Chapter 9 SD Card Operation on page 100 for more information on these functions.

^{**} These functions do not require a drive reset to become active. All other functions require a drive reset to initiate the function. Equivalent values and strings are also provided in the table above.

6.4 Full descriptions

Table 6-3 Key to parameter table coding

Coding	Attribute
RW	Read/Write: can be written by the user
RO	Read only: can only be read by the user
Bit	1 bit parameter. 'On' or 'Off' on the display
Num	Number: can be uni-polar or bi-polar
Txt	Text: the parameter uses text strings instead of numbers.
Bin	Binary parameter
IP	IP Address parameter
Mac	Mac Address parameter
Date	Date parameter
Time	Time parameter
Chr	Character parameter
FI	Filtered: some parameters which can have rapidly changing values are filtered when displayed on the drive keypad for easy viewing.
DE	Destination: This parameter selects the destination of an input or logic function.
RA	Rating dependent: this parameter is likely to have different values and ranges with drives of different voltage and current ratings. Parameters with this attribute will be transferred to the destination drive by non-volatile storage media when the rating of the destination drive is different from the source drive and the file is a parameter file. However, the values will be transferred if only the current rating is different and the file is a difference from default type file.
ND	No default: The parameter is not modified when defaults are loaded
NC	Not copied: not transferred to or from non-volatile media during copying.
PT	Protected: cannot be used as a destination.
US	User save: parameter saved in drive EEPROM when the user initiates a parameter save.
PS	Power-down save: parameter automatically saved in drive EEPROM when the under volts (UV) state occurs.

6.4.1 Parameter x.00

	00.0	000										
		000}	Parameter zero									
R۱	Ν	Num				N	D	NC	PT			
Û		(0 to 65,	535		$\qquad \qquad $						

6.4.2 Speed limits

00.001	{01	.007}	Minim	linimum Reference Clamp							
RW		Num						US			
OL			=						0.0 H	z	
RFC-A	\$			FIVE_F Hz / rp		\Rightarrow	0.0 rpm				
RFC-S											

(When the drive is jogging, [00.001] has no effect.)

Open-loop

Set Pr 00.001 at the required minimum output frequency of the drive for both directions of rotation. The drive speed reference is scaled between Pr 00.001 and Pr 00.002. [00.001] is a nominal value; slip compensation may cause the actual frequency to be higher.

RFC-A / RFC-S

Set Pr **00.001** at the required minimum motor speed for both directions of rotation. The drive speed reference is scaled between Pr **00.001** and Pr **00.002**

00.002	{01	.006}	Maxin	num R	eferen	ce (Clamp						
RW		Num					US						
OL			D001T					default default					
RFC-A	Û		VM_POSITIVE_REF_ CLAMP1 Hz / rpm				50Hz d 60Hz d						
RFC-S							3	3000.0	rpm				

(The drive has additional over-speed protection).

Open-loop

Set Pr 00.002 at the required maximum output frequency for both directions of rotation. The drive speed reference is scaled between Pr 00.001 and Pr 00.002. [00.002] is a nominal value; slip compensation may cause the actual frequency to be higher.

RFC-A / RFC-S

Set Pr 00.002 at the required maximum motor speed for both directions of rotation. The drive speed reference is scaled between Pr 00.001 and Pr 00.002.

For operating at high speeds see section 8.5 *High speed operation* on page 93.

6.4.3 Ramps, speed reference selection, current limit

00.003	00.003 {02.011} Acceleration Ra										
RW										US	
OL		0.0 to	0.0 to VM_ACCEL_RATE s/100 Hz					5.	0 s/10	0 Hz	
RFC-A	Û	\/\						2.00	0 s/10	00 rpm	ı
RFC-S		VIV	_	0 rpm	\			0.20	0 s/10	00 rpm	1

Set Pr 00.003 at the required rate of acceleration.

Note that larger values produce lower acceleration. The rate applies in both directions of rotation.

00.004	{02	2.021}	Deceleration Rate 1								
RW		Num								US	
OL		0.0 to	0.0 to VM_ACCEL_RATE s/100 Hz					10	.0 s/10	00 Hz	
RFC-A	Û	\/\	s/100 Hz 0.000 to				2.000 s/1000 rpm				1
RFC-S	VM_ACCEL_RATE							0.20	0 s/10	00 rpm	1

Set Pr 00.004 at the required rate of deceleration.

Note that larger values produce lower deceleration. The rate applies in both directions of rotation.

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Ontimization	SD Card	Onboard	Advanced	Diagnostics	UL listing
information	information	installation	installation	started	parameters	the motor	Optimization	Operation	PLC	parameters	Diagnostics	information

Use Pr 00.005 to select the required frequency/speed reference as follows:

Setting		Description
A1 A2	0	Analog input 1 OR analog input 2 selectable by digital input, terminal 28
A1 Preset	1	Analog input 1 OR preset frequency/speed
A2 Preset	2	Analog input 2 OR preset frequency/speed
Preset (3)	3	Pre-set frequency/speed
Keypad (4)	4	Keypad mode
Precision (5)	5	Precision reference
Keypad Ref (6)	6	Keypad Reference

00.006	{04	.007}	Symmetrical Current Limit								
RW		Num								US	
OL					- <i>i</i>				165 9	%	
RFC-A	${\mathfrak J}$		to VM_ RRENT		_	\Rightarrow			250 °	%	
RFC-S									200	, 0	

Pr 00.006 limits the maximum output current of the drive (and hence maximum motor torque) to protect the drive and motor from overload. Set Pr 00.006 at the required maximum torque as a percentage of the rated torque of the motor, as follows:

$$[00.006] = \frac{T_R}{T_{RATED}} \times 100 \text{ (\%)}$$

Where:

 T_{R} Required maximum torque

T_{RATED} Motor rated torque

Alternatively, set Pr 00.006 at the required maximum active (torqueproducing) current as a percentage of the rated active current of the motor, as follows:

$$[00.006] = \frac{I_R}{I_{RATED}} \times 100 \,(\%)$$

Where:

Required maximum active current I_R

I_{RATED} Motor rated active current

6.4.4 Voltage boost, (open-loop), Speed-loop PID gains (RFC-A / RFC-S)

00.007 {	05.0	014}	Open	-loop	Contr	ol N	/lode ((OL))		
00.007 {	03.0	010}	Spee	d Con	troller	Pro	oporti	ona	l Gain	Kp1 (RFC)
RW		Txt / Num								US	
OL		Fixed	(0), Ur (2), U 1), Squ	r Auto		⇧					
RFC-A	⇧	0 000	0 to 20	nn nnn	s/rad	Û	0.0300 s/rad				
RFC-S	❖	0.000	0 10 20	70.000	3/1au	0.0100 s/rad					

Open-loop

There are six voltage modes available, which fall into two categories, vector control and fixed boost. For further details, refer to section Pr 00.007 {05.014} Open Loop Control Mode on page 83.

RFC-A/RFC-S

Pr 00.007 (03.010) operates in the feed-forward path of the speedcontrol loop in the drive. See Figure 11-4 on page 126 for a schematic of the speed controller. For information on setting up the speed controller gains, refer to Chapter 8 Optimization on page 77.

00.008 {	05.0	015}	Low	Frequ	ency \	/olta	age Boo	ost (OL)				
00.008 {	03.	011}	Spee	d Con	troller	Int	egral G	ain Ki1 ((RFC)			
RW		Num		US								
OL	Û	(0.0 to 2	25.0 %	0	\Diamond		3.0 %	%			
RFC-A	Û	0.00	to 651	5.35 s ²	2/rod	⇧		$0.10 s^2$	/rad			
RFC-S	*	0.00	10 05	5.55 8	/Iau			1.00 s^2	/rad			

Open-loop

When Open-loop Control Mode (00.007) is set at Fd or SrE, set Pr 00.008 (05.015) at the required value for the motor to run reliably at

Excessive values of Pr 00.008 can cause the motor to be overheated.

RFC-A/RFC-S

Pr 00.008 (03.011) operates in the feed-forward path of the speedcontrol loop in the drive. See Figure 11-4 on page 126 for a schematic of the speed controller. For information on setting up the speed controller gains, refer to Chapter 8 Optimization on page 77.

00.009 {	05.0	013}	Dyna	mic V	to F S	Sele	ct (OL)				
00.009 {	[03.0	012}	Speed Controller Differential Feedback Gain Kd 1 (RFC)									
RW		Bit						US				
OL	Û	0	ff (0) c	or On ((1)	\Diamond		Off (0)				
RFC-A RFC-S	Û	(0.00000 to 0.65535 1/rad			⇧	0.00000 1/rad					

Open-loop

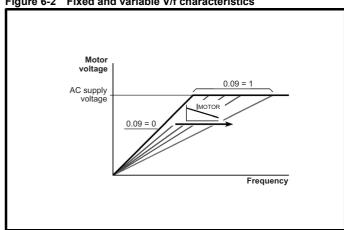

Set Pr 00.009 (05.013) at 0 when the V/f characteristic applied to the motor is to be fixed. It is then based on the rated voltage and frequency of the motor.

Set Pr 00.009 at 1 when reduced power dissipation is required in the motor when it is lightly loaded. The V/f characteristic is then variable resulting in the motor voltage being proportionally reduced for lower motor currents. Figure 6-2 shows the change in V/f slope when the motor current is reduced.

RFC-A / RFC-S

Pr 00.009 (03.012) operates in the feedback path of the speed-control loop in the drive. See Figure 11-4 Menu 3 RFC-A, RFC-S logic diagram on page 126 for a schematic of the speed controller. For information on setting up the speed controller gains, refer to Chapter 8 Optimization on page 77.

Figure 6-2 Fixed and variable V/f characteristics

6.4.5 Monitoring

00.01	0 {0	5.004}	Motor	Rpm				
R)	Bit					US	
OL	Û		±18000	00 rpm	\Diamond			

Open-loop

Pr 00.010 (05.004) indicates the value of motor speed that is estimated from the following:

02.001 Post Ramp Reference **00.042** Number Of Motor Poles

002}	Speed	l Feedl	oack						
Num	FI			N	D	NC	PT		
VI	M_SPE	EED rpi	m	①					
	Num	Num FI	Num FI		Num FI N	Num FI ND	Num FI ND NC	Num FI ND NC PT	Num FI ND NC PT

RFC-A / RFC-S

Pr 00.010 (03.002) indicates the value of motor speed that is obtained from the speed feedback.

00.011 {	05.	001}	Outp	ut Fre	quenc	y (C	L)					
00.011 {	03.	029}	P1 Pc	sitior	ı (RFC)						
RO		Num	FI ND NC PT									
OL	ĵţ	VM_	-	SPEED_FREQ_ ⇒								
RFC-A	❖		REF	Hz								
RFC-S	Û		0 to 6	0 to 65535								

Open-loop and RFC-A

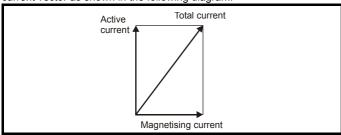

Pr 00.011 displays the frequency at the drive output.

RFC-S

Pr **00.011** displays the position of the encoder in mechanical values of 0 to 65,535. There are 65,536 units to one mechanical revolution.

00.012	{04	.001}	Curre	nt Mag	nitude					
RO		Bit	FI			NE)	NC	PT	
OL RFC-A RFC-S		_	0.00 DRIVE_ UNIPC	CURR	_	廿				

Pr **00.012** displays the rms value of the output current of the drive in each of the three phases. The phase currents consist of an active component and a reactive component, which can form a resultant current vector as shown in the following diagram.

The active current is the torque producing current and the reactive current is the magnetizing or flux-producing current.

00.013	{04	.002}	Torqu	e Prod	ucing	Cur	ren	t				
RO		Bit	FI			N	D	NC	PT			
OL												
RFC-A	${\mathfrak J}$	VM_D	RIVE_	CURRI	ENT A	\Rightarrow						
RFC-S			VM_DRIVE_CURRENT A ⇒									

When the motor is being driven below its rated speed, the torque is proportional to [00.013].

6.4.6 Jog reference, Ramp mode selector, Stop and torque mode selectors

Pr **00.014** is used to select the required control mode of the drive as follows:

00.015	{02	.004}	Ramp	Mode	Select					
RW		Txt							US	
OL	⇕	Fast	t (0), St Std bo		. ,	\Diamond	St	andar	d (1)	
RFC-A RFC-S	\$	Fas	t (0), S	tandard	d (1)	\Diamond		Fast (0)	

Pr **00.015** sets the ramp mode of the drive as shown below:

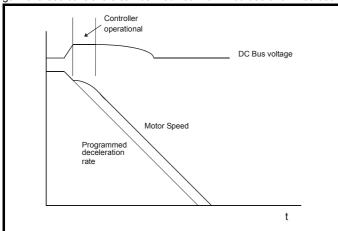

0: Fast ramp

Fast ramp is used where the deceleration follows the programmed deceleration rate subject to current limits. This mode must be used if a braking resistor is connected to the drive.

1: Standard ramp

Standard ramp is used. During deceleration, if the voltage rises to the standard ramp level (Pr **02.008**) it causes a controller to operate, the output of which changes the demanded load current in the motor. As the controller regulates the link voltage, the motor deceleration increases as the speed approaches zero speed. When the motor deceleration rate reaches the programmed deceleration rate the controller ceases to operate and the drive continues to decelerate at the programmed rate. If the standard ramp voltage (Pr **02.008**) is set lower than the nominal DC bus level the drive will not decelerate the motor, but it will coast to rest.

The output of the ramp controller (when active) is a current demand that is fed to the frequency changing current controller (Open-loop modes) or the torque producing current controller (RFC-A or RFC-S modes). The gain of these controllers can be modified with Pr 00.038 and Pr 00.039.

2: Standard ramp with motor voltage boost

This mode is the same as normal standard ramp mode except that the motor voltage is boosted by 20 %. This increases the losses in the motor, dissipating some of the mechanical energy as heat giving faster deceleration.

00.016	{02	2.002}	Ramp	Enabl	le					
RW		Bit							US	
OL	Û					\Diamond				
RFC-A	ĵ;		Off (0) o	or On (1)	U		On (1	1)	
RFC-S) (0) C	511 (• ,			5 11 (' /		

Setting Pr **00.016** to 0 allows the user to disable the ramps. This is generally used when the drive is required to closely follow a speed reference which already contains acceleration and deceleration ramps.

00.017	{04	.012}	Current Reference Filter Time Constant

RFC-A	⇧		0 0 to 2		Û			0 0 m	0.0 ms			
RFC-S	Ŷ		0.0 to 25.0 ms			7		0.0 1115				

RFC-A / RFC-S

A first order filter, with a time constant defined by Pr **00.017**, is provided on the current demand to reduce acoustic noise and vibration produced as a result of position feedback quantisation noise. The filter introduces a lag in the speed loop, and so the speed loop gains may need to be reduced to maintain stability as the filter time constant is increased.

00.018	{03	3.123}	P1 Thermistor Fault Detection									
RW												
OL RFC-A	₿		None (0), Temperature (1), Temp and short (2)						None	(0)		
RFC-S		ie	mp and		Temperature (1)							

Defines the fault detection for the P1 thermistor input:

P1 Thermistor Fault Detection (03.123)	Fault detection
0: None	No detection active
1: Temperature	Over temperature detection
2: Temp and short	Over temperature and short circuit detection

If over temperature detection is enabled a *Thermistor*.001 trip is initiated if *P1 Thermistor Feedback* (03.119) is above the level defined by *P1 Thermistor Trip Threshold* (03.120). The trip cannot be reset until *P1 Thermistor Feedback* (03.119) is below *P1 Thermistor Reset Threshold* (03.121).

If short circuit detection is enabled then a *Th Short Circuit*.001 is initiated if *P1 Thermistor Feedback* (03.119) is below 50 Ohms.

Open-loop

When the drive is enabled with Pr 00.033 = 0, the output frequency starts at zero and ramps to the required reference. When the drive is enabled when Pr 00.033 has a non-zero value, the drive performs a start-up test to determine the motor speed and then sets the initial output frequency to the synchronous frequency of the motor.

Restrictions may be placed on the frequencies detected by the drive as follows:

Pr 00.033	Pr string	Function
0	Disable	Disabled
1	Enable	Detect all frequencies
2	Fwd only	Detect positive frequencies only
3	Rev only	Detect negative frequencies only

RFC-A

The Rated Frequency (00.047) and Rated Speed (00.045) are used to define the rated slip of the motor. The rated slip is used in sensorless mode (Sensorless Mode Active (03.078) = 1) to correct the motor speed with load. When this mode is active Rated Speed Optimisation Select (00.033) has no effect.

If sensorless mode is not active (Sensorless Mode Active (03.078) = 0) the rated slip is used in the motor control algorithm and an incorrect value of slip can have a significant effect on the motor performance. If Rated Speed Optimisation Select (00.033) = 0 then the adaptive control system is disabled. However, if Rated Speed Optimisation Select (00.033) is set to a non-zero value the drive can automatically adjust the Rated Speed (00.045) to give the correct value of rated slip. Rated Speed (00.045) is not saved at power-down, and so when the drive is powered-down and up again it will return to the last value saved by the user. The rate of convergence and the accuracy of the adaptive controller reduces at low output frequency and low load. The minimum frequency is defined as a percentage of Rated Frequency (00.047) by Rated Speed Optimisation Minimum Frequency (05.019). The minimum load is defined as a percentage of rated load by Rated Speed Optimisation Minimum Load (05.020). The adaptive controller is enabled when a motoring or regenerative load rises above Rated Speed Optimisation Minimum Load (05.020) + 5 %, and is disabled again when it falls below Rated Speed Optimisation Minimum Load (05.020). For best optimisation results the correct values of Stator Resistance (05.017), Transient Inductance (05.024), Stator Inductance (05.025), Saturation Breakpoint 1 (05.029), Saturation Breakpoint 2 (05.062), Saturation Breakpoint 3 (05.030) and Saturation Breakpoint 4 (05.063) should be used.

15	7 1 OP M

The core drive always uses the Modbus rtu protocol and is always a slave. *Serial Mode* (00.035) defines the data format used by the serial comms interface. The bits in the value of *Serial Mode* (00.035) define the data format as follows. Bit 3 is always 0 in the core product as 8 data bits are required for Modbus rtu. The parameter value can be extended in derivative products which provide alternative communications protocols if required.

Bits	3	2	1 and 0
Format	Number of data bits 0 = 8 bits 1 = 7 bits	Register mode 0 = Standard 1 = Modified	Stop bits and Parity 0 = 2 stop bits, no parity 1 = 1 stop bit, no parity 2 = 1 stop bit, even parity 3 = 1 stop bit, odd parity

Bit 2 selects either standard or modified register mode. The menu and parameter numbers are derived for each mode as given in the following table. Standard mode is compatible with Unidrive SP. Modified mode is provided to allow register numbers up to 255 to be addressed. If any menus with numbers above 63 should contain more than 99 parameters, then these parameters cannot be accessed via Modbus rtu.

Register mode	Register address
Standard	$(mm \times 100) + ppp - 1 \text{ where } mm \le 162 \text{ and } ppp \le 99$
Modified	(mm x 256) + ppp - 1 where mm ≤ 63 and ppp ≤ 255

Changing the parameters does not immediately change the serial communications settings. See *Reset Serial Communications* (11.020) for more details

00.036	{11	.025}	Serial	Baud	Rate					
RW		Txt							US	
OL .		24	` ''	4800 (4),

These parameters control the proportional and integral gains of the current controller used in the open loop drive. The current controller either provides current limits or closed loop torque control by modifying the drive output frequency. The control loop is also used in its torque mode during line power supply loss, or when the controlled mode standard ramp is active and the drive is decelerating, to regulate the flow of current into the drive.

Open-Loop

There are two autotune tests available in open loop mode, a stationary and a rotating test. A rotating autotune should be used whenever possible so the measured value of power factor of the motor is used by the drive.

- A stationary autotune can be used when the motor is loaded and it is not possible to remove the load from the motor shaft. The stationary test measures the Stator Resistance (05.017), Transient Inductance (05.024), Maximum Deadtime Compensation (05.059) and Current At Maximum Deadtime Compensation (05.060) which are required for good performance in vector control modes (see Open Loop Control Mode (00.007), later in this table). The stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr 00.043. To perform a Stationary autotune, set Pr 00.040 to 1, and provide the drive with both an enable signal (terminal 2 and 6) and a run signal (terminal 11 or 13).
- A rotating autotune should only be used if the motor is unloaded. A
 rotating autotune first performs a stationary autotune, as above, then
 a rotating test is performed in which the motor is accelerated with
 currently selected ramps up to a frequency of Rated Frequency
 (05.006) x 2/3, and the frequency is maintained at that level for
 4 seconds. Stator Inductance (05.025) is measured and this value is

used in conjunction with other motor parameters to calculate *Rated Power Factor* (00.043). To perform a Rotating autotune, set Pr **00.040** to 2, and provide the drive with both an enable signal (terminal 2 and 6) and a run signal (terminal 11 or 13).

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the Safe Torque Off signal from terminal 2 and 6, setting the *Drive Enable* (06.015) to OFF (0) or disabling the drive via the *Control Word* (06.042) and *Control Word Enable* (06.043).

RFC-A

There are four autotune tests available in RFC-A mode, a stationary test, a rotating test, two mechanical load measurement tests. A stationary autotune will give moderate performance whereas a rotating autotune will give improved performance as it measures the actual values of the motor parameters required by the drive. A mechanical load measurement test should be performed separately to a stationary or rotating autotune.

NOTE

It is highly recommended that a rotating autotune is performed (Pr **00.040** set to 2).

- A stationary autotune can be used when the motor is loaded and it is not possible to remove the load from the motor shaft. The stationary autotune measures the *Stator Resistance* (05.017) and *Transient Inductance* (05.024) of the motor. These are used to calculate the current loop gains, and at the end of the test the values in Pr 00.038 and Pr 00.039 are updated. A stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr 00.043. To perform a Stationary autotune, set Pr 00.040 to 1, and provide the drive with both an enable signal (terminal 2 and 6) and a run signal (terminal 11 or 13).
- A rotating autotune should only be used if the motor is unloaded. A rotating autotune first performs a stationary autotune, a rotating test is then performed which the motor is accelerated with currently selected ramps up to a frequency of *Rated Frequency* (00.047) x 2/3, and the frequency is maintained at the level for up to 40 s. During the rotating autotune the *Stator Inductance* (05.025), and the motor saturation breakpoints (Pr 05.029, Pr 05.030, Pr 06.062 and Pr 05.063) are modified by the drive. The *Motor Rated Power Factor* (00.043) is also modified by the *Stator Inductance* (05.025). The No-Load motor core losses are measured and written to *No-Load Core Loss* (04.045). To perform a Rotating autotune, set Pr 00.040 to 2, and provide the drive with both an enable signal (terminal 2 and 6) and a run signal (terminal 11 or 13).

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the Safe Torque Off signal from terminal 2 and 6, setting the *Drive Enable* (06.015) to OFF (0) or disabling the drive via the control word (Pr **06.042** & Pr **06.043**).

RFC-S

There are five autotune tests available in RFC-S mode, a stationary autotune, a rotating autotune, two mechanical load measurement tests and a locked rotor test to measure load dependent parameters.

· Stationary Autotune

The stationary autotune can be used when the motor is loaded and it is not possible uncouple the load from motor shaft. This test can be used to measure all the necessary parameters for basic control. During the stationary autotune, a test is performed to locate the flux axis of the motor. However this test may not be able to calculate such an accurate value for the Position Feedback Phase Angle (00.043) as compared to rotating autotune. A stationary test is performed to measure *Stator Resistance* (05.017), *Ld* (05.024), *Maximum Deadtime Compensation* (05.059), *Current At Maximum Deadtime Compensation* (05.060),

No Load Lq (05.072). If Enable Stator Compensation (05.049) = 1 then Stator Base Temperature (05.048) is made equal to Stator Temperature (05.046). The Stator Resistance (05.017) and the Ld (05.024) are then used to set up Current controller Kp Gain (00.038) and Current Controller Ki Gain (00.039). If sensorless mode is not selected then Position Feedback Phase Angle (00.043) is set up for the position from the position feedback interface selected with Motor Control Feedback Select (03.026). To perform a Stationary autotune, set Pr 00.040 to 1, and provide the drive with both an enable signal (terminal 2 and 6) and a run signal (terminal 11 or 13).

Rotating Autotune

The rotating autotune must be performed on unloaded motor. This test can be used to measure all the necessary parameters for the basic control and parameters for cancelling the effects of the cogging torque. During the rotating autotune, Rated Current (00.046) is applied and the motor is rotated by 2 electrical revolutions (i.e. up to 2 mechanical revolutions) in the required direction. If sensorless mode is not selected then the Position Feedback Phase Angle (00.043) is set-up for the position from the position feedback interface selected with Motor Control revolutions) in the required direction. If sensorless mode is not selected then the Position Feedback Phase Angle (00.043) is set-up for the position from the position feedback interface selected with Motor Control Feedback Select (03.026). A stationary test is then performed to measure Stator Resistance (05.017), Ld (05.024), Maximum Deadtime Compensation (05.059), Current At Maximum Deadtime Compensation (05.060) and No Load Lq (05.072). Stator Resistance (05.017) and Ld (05.024) are used to set up Current Controller Kp Gain (00.038) and Current Controller Ki Gain (00.039). This is only done once during the test, and so the user can make further adjustments to the current controller gains if required. To perform a Rotating autotune, set Pr 00.040 to 2, and provide the drive with both an enable signal (terminal 2 and 6) and a run signal (terminal 11 or 13).

	.04 .01		Maxin	num S	witchir	ıg F	req	uency	,			
RW		Txt				R	RA	NC				
OL				Iz (0), 3 kHz (1),								
RFC-A	${\mathfrak J}$		Hz (2), Hz (4),			\Rightarrow			8 kHz	(4)		
RFC-S			16 kH	Hz (6)	• • •							

This parameter defines the required switching frequency. The drive may automatically reduce the actual switching frequency (without changing this parameter) if the power stage becomes too hot. A thermal model of the IGBT junction temperature is used based on the heatsink temperature and an instantaneous temperature drop using the drive output current and switching frequency. The estimated IGBT junction temperature is displayed in Pr 07.034. If the temperature exceeds 135 °C the switching frequency is reduced if this is possible (i.e >3 kHz). Reducing the switching frequency reduces the drive losses and the junction temperature displayed in Pr 07.034 also reduces. If the load condition persists the junction temperature may continue to rise again above 145 °C and the drive cannot reduce the switching frequency further the drive will initiate an 'OHt Inverter' trip. Every second the drive will attempt to restore the switching frequency to the level set in Pr 00.041.

See section 8.4 *Switching frequency* on page 93, for the maximum available switching frequency for each drive rating.

OL	Û	0	.000 t	000 to 1.000							
RFC-A	Û	0	0.000 to 1.000			\Diamond	0.850			0	
RFC-S	Û	(0.0 to 359.9 °			\Rightarrow			0.0	0	

The power factor is the true power factor of the motor, i.e. the angle between the motor voltage and current.

Open-loop

The power factor is used in conjunction with the motor rated current (Pr **00.046**) to calculate the rated active current and magnetizing current of the motor. The rated active current is used extensively to control the drive, and the magnetizing current is used in vector mode Rs compensation. It is important that this parameter is set up correctly.

This parameter is obtained by the drive during a rotational autotune. If a stationary autotune is carried out, then the nameplate value should be entered in Pr **00.043**.

RFC-A

If the stator inductance (Pr **05.025**) contains a non-zero value, the power factor used by the drive is continuously calculated and used in the vector control algorithms (this will not update Pr **00.043**).

If the stator inductance is set to zero (Pr **05.025**) then the power factor written in Pr **00.043** is used in conjunction with the motor rated current and other motor parameters to calculate the rated active and magnetizing currents which are used in the vector control algorithm.

This parameter is obtained by the drive during a rotational autotune. If a stationary autotune is carried out, then the nameplate value should be entered in Pr **00.043**.

RFC-S

The phase angle between the rotor flux in a servo motor and the encoder position is required for the motor to operate correctly. If the phase angle is known it can be set in this parameter by the user. Alternatively the drive can automatically measure the phase angle by performing a phasing test (see autotune in RFC-S mode Pr 00.040). When the test is complete the new value is written to this parameter. The encoder phase angle can be modified at any time and becomes effective immediately. This parameter has a factory default value of $0.0\,^\circ$, but is not affected when defaults are loaded by the user.

RFC-S 🔃				ightharpoons		3	00.00	rpm			

Open-loop

This is the speed at which the motor would rotate when supplied with its base frequency at rated voltage, under rated load conditions (= synchronous speed - slip speed). Entering the correct value into this parameter allows the drive to increase the output frequency as a function of load in order to compensate for this speed drop.

Slip compensation is disabled if Pr 00.045 is set to 0 or to synchronous speed, or if Pr 05.027 is set to 0.

If slip compensation is required this parameter should be set to the value from the rating plate of the motor, which should give the correct rpm for a hot machine. Sometimes it will be necessary to adjust this when the drive is commissioned because the nameplate value may be inaccurate. Slip compensation will operate correctly both below base speed and within the field weakening region. Slip compensation is normally used to correct for the motor speed to prevent speed variation with load. The rated load rpm can be set higher than synchronous speed to deliberately introduce speed droop. This can be useful to aid load sharing with mechanically coupled motors.

RFC-A

Rated speed is used with motor rated frequency to determine the full load slip of the motor which is used by the vector control algorithm. Incorrect setting of this parameter can result in the following:

- · Reduced efficiency of motor operation
- Reduction of maximum torque available from the motor
- Failure to reach maximum speed
- Over-current trips
- · Reduced transient performance
- · Inaccurate control of absolute torque in torque control modes

The nameplate value is normally the value for a hot machine, however, some adjustment may be required when the drive is commissioned if the nameplate value is inaccurate.

The rated speed rpm can be optimized by the drive (For further information, refer to section 8.1.4 *RFC-A mode* on page 85).

RFC-S

Rated Speed (00.045) is used as follows:

- Operation without position feedback, i.e. Sensorless Mode Active (03.078) = 1.
- Where the motor operates above this speed and flux weakening is active.
- 3. In the motor thermal model.

The units for *Rated Speed* (00.045) are always rpm even if a linear motor is used and *Linear Speed Select* (01.055) = 1.

00.051	{10	.037}	Action On Trip Detection								
RW		Bin								US	
OL											
RFC-A	${\mathfrak J}$		0 to 31			\Diamond			0		
RFC-S											

Each bit in this parameter has the following functions:

Bit	Function
0	Stop on non-important trips
1	Disable braking resistor overload detection
2	Disable phase loss stop
3	Disable braking resistor temperature monitoring
4	Disable parameter freeze on trip

Example

Pr **00.051** =8 (1000_{binary}) Th Brake Res trip is disabled

Pr **00.051** =12 (1100_{binary}) Th Brake Res and phase loss trip is disabled

Stop on non-important trips

If bit 0 is set to one the drive will attempt to stop before tripping if any of the following trip conditions are detected: I/O Overload, An Input 1 Loss, An Input 2 Loss or Keypad Mode.

Disable braking resistor overload detection

For details of braking resistor overload detection mode see Pr 10.030.

Disable phase loss trip

Normally the drive will stop when the input phase loss condition is detected. If this bit is set to 1 the drive will continue to run and will only trip when the drive is brought to a stop by the user.

Disable braking resistor temperature monitoring

Size 3, 4 and 5 drives have an internal user install braking resistor with a thermistor to detect overheating of the resistor. As default bit 3 of Pr **00.051** is set to zero, and so if the braking resistor and its thermistor is not installed the drive will produce a trip (Th Brake Res) because the

thermistor appears to be open-circuit. This trip can be disabled so that the drive can run by setting bit 3 of Pr **00.051** to one. If the resistor is installed then no trip is produced unless the thermistor fails, and so bit 3 of Pr **00.051** can be left at zero. This feature only applies to size 3, 4 and 5 drives. For example if Pr **00.051** = 8, then Th Brake Res trip will be disabled.

Disable parameter freeze on trip

If this bit is 0 then the parameters listed below are frozen on trip until the trip is cleared. If this bit is 1 then this feature is disabled.

Pr 00.053 is the motor thermal time constant of the motor, and is used (along with the motor rated current Pr 00.046, and total motor current Pr 00.012) in the thermal model of the motor in applying thermal protection to the motor.

For further details, refer to section 8.3 *Motor thermal protection* on page 92.

Safety Product Mechanical Electrical Getting Basic Running the motor SD Card Onboard Advanced **UL** listing Optimization Diagnostics information installation parameters **PLC** parameters information

7 Running the motor

This chapter takes the new user through all the essential steps to running a motor for the first time, in each of the possible operating modes.

For information on tuning the drive for the best performance, see Chapter 8 *Optimization* on page 77.

Ensure that no damage or safety hazard could arise from the motor starting unexpectedly.

The values of the motor parameters affect the protection of the motor.

The default values in the drive should not be relied upon. It is essential that the correct value is entered in Pr **00.046** *Rated Current*. This affects the thermal protection of the motor

If the drive is started using the keypad it will run to the speed defined by the keypad reference (Pr 01.017). This may not be acceptable depending on the application. The user must check in Pr 01.017 and ensure that the keypad reference has been set to 0.

If the intended maximum speed affects the safety of the machinery, additional independent over-speed protection must be used.

7.1 Quick start connections

7.1.1 Basic requirements

This section shows the basic connections which must be made for the drive to run in the required mode. For minimal parameter settings to run in each mode please see the relevant part of section 7.3 *Quick start commissioning / start-up* on page 60.

Table 7-1 Minimum control connection requirements for each control mode

Drive control method	Requirements
Terminal mode	Drive enable Speed / Torque reference Run forward / Run reverse
Keypad mode	Drive enable
Serial communications	Drive enable Serial communications link

Table 7-2 Minimum control connection requirements for each mode of operation

Operating mode	Requirements
Open loop mode	Induction motor
RFC – A mode (with speed feedback)	Induction motor with speed feedback
RFC - S mode (with speed and position feedback)	Permanent magnet motor with speed and position feedback

Speed feedback

Suitable devices are:

- Incremental encoder (A, B or F, D with or without Z).
- Incremental encoder with forward and reverse outputs (F, R with or without Z).
- SINCOS encoder (with, or without Stegmann Hiperface, EnDat, BiSS or SSI communications protocols).
- · EnDat absolute encoder.
- BiSS absolute encoder.
- · Resolver.

Speed and position feedback

Suitable devices are:

- Incremental encoder (A, B or F, D with or without Z) with commutation signals (U, V, W).
- Incremental encoder with forward and reverse outputs (F, R with or without Z) and commutation outputs (U, V, W).
- SINCOS encoder (with Stegmann Hiperface, EnDat, BiSS or SSI communications protocols)
- · EnDat absolute encoder.
- · BiSS absolute encoder.
- Resolver.

7.2 Changing the operating mode

Changing the operating mode returns all parameters to their default value, including the motor parameters. *User Security Status* (Pr **00.049**) and *User Security Code* (Pr **00.034**) are not affected by this procedure).

Procedure

Use the following procedure only if a different operating mode is required:

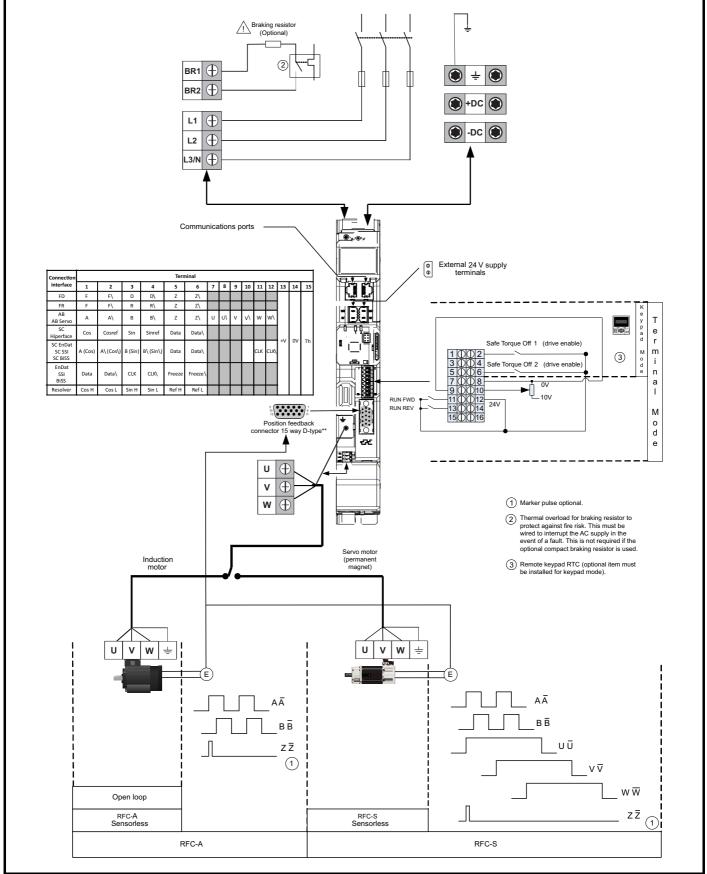

- Enter either of the following values in Pr mm.000, as appropriate: 1253 (50 Hz AC supply frequency) 1254 (60 Hz AC supply frequency)
- Change the setting of Pr 00.048 as follows:

Pr 00.048 setting		Operating mode
00.048 † Open-loop	1	Open-loop
00.048 t RFC-A	2	RFC-A
00.048 t RFC-S	3	RFC-S

The figures in the second column apply when serial communications are used.

- 3. Either:
- Press the red reset button
- · Toggle the reset digital input
- Carry out a drive reset through serial communications by setting Pr 10.038 to 100 (ensure that Pr. mm.000 returns to 0).

7.3 Quick start commissioning / start-up

7.3.1 RFC-S mode (with position feedback)

Permanent magnet motor with position feedback
For simplicity only an incremental quadrature encoder with commutation outputs will be considered here. For information on setting up one of the other supported speed feedback devices, refer to section 7.5 Setting up a feedback device on page 69.

Action	Detail	
Before power- up	Ensure: The drive enable signal is not given (terminal 2 & 6). Run signal is not given. Motor and feedback device are connected. Verify that RFC-S mode is displayed as the drive powers up. If the mode is incorrect see section 5.6 <i>KI-Remote</i>	X
Power-up the drive	Keypad changing the operating mode on page 39. Ensure: Drive displays 'inhibit' If the drive trips, see Chapter 12 Diagnostics on page 192.	[7
Set motor feedback parameters	Incremental encoder basic set-up Enter: Drive encoder type in Pr. 03.038 = AB Servo (3): Quadrature encoder with commutation outputs. Encoder power supply in Pr. 03.036 = 5 V (0), 8 V (1) or 15 V (2). NOTE If output voltage from the encoder is >5 V, then the termination resistors must be disabled Pr 03.039 to 0. Setting the encoder voltage supply too high for the encoder could result in damage to the feedback device. Drive encoder Pulses Per Revolution in Pr 03.034 (set according to encoder) Drive encoder termination resistor setting in Pr 03.039: 0 = A-A B-B Z-Z\ termination resistors disabled 1 = A-A B-B Z-Z\ termination resistors enabled, Z-Z\ termination resistors disabled 2 = A-A B-B Z-Z\ termination resistors enabled	
Enter motor nameplate details	 Enter: Motor rated current in Pr 00.046 (A) Ensure that this equal to or less than the Heavy Duty rating of the drive otherwise 'Motor Too Hot' trips may occur during the autotune. Number of poles in Pr 00.042 Motor rated voltage in Pr 00.044 (V) 	September 1997
Set maximum speed	Enter: • Maximum speed in Pr 00.002 (rpm)	0.02
Set acceleration / deceleration rates	 Enter: Acceleration rate in Pr 00.003 (s/1000 rpm) Deceleration rate in Pr 00.004 (s/1000 rpm) (If braking resistor installed, set Pr 00.015 = Fast. Also ensure Pr 10.030, Pr 10.031 and Pr 10.061 are set correctly, otherwise premature 'Brake R Too Hot' trips may be seen). 	1000pm
Motor thermistor set- up	The motor thermistor connection is made through the drive encoder port (terminal 15). The thermistor type is selected in <i>P1 Thermistor Type</i> (03.118). Motor thermistor fault detection is enabled as default, it can be deselected in Pr 03.123 . Refer to Pr 03.123 for further information.	

Autotune Autotu	Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	SD Card Operation	Onboard PLC	Advanced parameters	Diagnostics	UL listing information
The drive is able to perform either a stationary or a rotating autotune. The motor must be at a standstill before an autotune is enabled. A stationary autotune will give moderate performance whereas a rotating autotune will give improved performance as it measures the actual values of the motor parameters required by the drive. The drive is able to perform a stationary, rotating, mechanical load measurement or locked rotor test autotune. The motor must be at a standstill before an autotune is enabled. It is suggested that a rotating auto tune is used for accurate measurement for position feedback phase angle. • A stationary autotune can be used when the motor is loaded and it is not possible to uncouple the load from the motor shaft. A stationary autotune is performed to locate the flux axis of the motor. The stationary autotune measures the stator resistance, inductance in flux axis, maximum deadtime compensation, inductance in torque axis with no load on the motor and current at maximum deadtime compensation of the motor. These are used to calculate the current loop gains, and at the end of the test the values in Pr 00.038 and Pr 00.039 are updated. If Sensorless mode is not selected then Position Feedback Phase Angle (00.043) is set-up for the selected position feedback. • A rotating autotune should only be used if the motor is uncoupled. The rotating autotune will rotate the motor by up to 2 mechanical revolutions in the direction selected, regardless of the reference provided to obtain the position feedback phase angle. A stationary autotune is then performed to obtain stator resistance, inductance in flux axis, maximum deadtime compensation of the motor. From the above obtained parameters the current loop gains are calculated, and at the end of the test the values in Pr 00.038 and Pr 00.039 are updated. The rotating autotune will rotate the motor by up to 2 mechanical revolutions in the direction selected, regardless of the reference provided. After a short delay, the motor is further rotated through a	Action							Detail

7.3.2 RFC-S mode (Sensorless control)

Permanent magnet motor without position feedback

Action	Detail	
Before power- up	Ensure: The drive enable signal is not given (terminal 2 & 6). Run signal is not given. Motor is connected.	X
Power-up the drive	Verify that RFC-S mode is displayed as the drive powers up. If the mode is incorrect see section 5.6 <i>KI-Remote Keypad changing the operating mode</i> on page 39, otherwise restore parameter defaults (see section 5.8 <i>Restoring parameter defaults</i> on page 39). Ensure: • Drive displays 'inhibit' If the drive trips, see Chapter 12 <i>Diagnostics</i> on page 192.	7
Select RFC-S (Sensorless control) mode and disable encoder wire- break trip	 Set Pr 03.024 = 1 or 3 to select RFC-S Sensorless mode Set Pr 03.040 = 0000 to disable the wire break 	
Enter motor nameplate details	 Enter: Motor rated current in Pr 00.046 (A) Ensure that this equal to or less than the Heavy Duty rating of the drive otherwise 'Motor Too Hot' trips may occur during the autotune. Number of poles in Pr 00.042 Motor rated voltage in Pr 00.044 (V) 	The state of the s
Set maximum speed	Enter: • Maximum speed in Pr 00.002 (rpm)	0.02
Set acceleration / deceleration rates	 Enter: Acceleration rate in Pr 00.003 (s/1000 rpm). It is recommended that the ramp rates are increased from the default value of 0.200 s/1000 rpm. Deceleration rate in Pr 00.004 (s/1000 rpm) (If braking resistor installed, set Pr 00.015 = Fast. Also ensure Pr 10.030, Pr 10.031 and Pr 10.061 are set correctly, otherwise premature 'Brake R Too Hot' trips may be seen). 	1000 pm
Set stop mode	Enter: Set Stop Mode to Ramp in Pr 06.001	
Set hold zero speed	Enter: Set Hold Zero Speed to Off (0) in Pr 06.008.	
Autotune	 The drive is able to perform a stationary autotune. The motor must be at a standstill before an autotune is enabled. A stationary autotune will give moderate performance. A stationary autotune is performed to locate the flux axis of the motor. The stationary autotune measures the stator resistance, inductance in flux axis, inductance in torque axis with no load on the motor and values relating to deadtime compensation from the drive. Measured values are used to calculate the current loop gains, and at the end of the test the values in Pr 00.038 and Pr 00.039 are updated. To perform an autotune: Set Pr 00.040 = 1 or 2 for a stationary autotune. (Both perform the same tests). Close the run signal (terminal 11 or 13). Close the drive enable signal (terminal 2 & 6). The upper row of the display will flash 'Auto Tune' while the drive is performing the test. Wait for the drive to display 'Ready' or 'Inhibit' and for the motor to come to a standstill. If the drive trips it cannot be reset until the drive enable signal (terminal 2 & 6) has been removed. See Chapter 12 Diagnostics on page 192. Remove the drive enabled and run signal from the drive. 	R, Ef No-load Lq
Check Saliency	In sensorless mode, when the motor speed is below Pr 00.045 / 10, a special low speed algorithm must be used to control the motor. There are two modes available, with the mode chosen based on the saliency of the motor. The ratio No-load Lq (Pr 00.056) / Ld (Pr 05.024) provides a measure of the saliency. If this value is > 1.1, then Injection (0) mode may be used. Current (2) mode may be used (but with limitations). If this value is < 1.1, then Current (2) mode must be used (this is the default of Pr 05.064).	
Save parameters	Select 'Save Parameters' in Pr mm.000 (alternatively enter a value of 1001 in Pr mm.000) and press red reset button or toggle the reset digital input.	
Run	Drive is now ready to run	•

7.3.3 Open loop

Action	Detail	
Action	Detail	
Before power-up	Ensure: The drive enable signal is not given (terminal 2 & 6). Run signal is not given. Motor is connected.	
Power-up the drive	Verify that Open Loop mode is displayed as the drive powers up. If the mode is incorrect see section 5.6 <i>KI-Remote Keypad changing the operating mode</i> on page 39. Ensure: • Drive displays 'Inhibit' If the drive trips, see section 12 <i>Diagnostics</i> on page 192.	7
Enter motor nameplate details	Enter: • Motor rated frequency in Pr 00.047 (Hz) • Motor rated current in Pr 00.046 (A) • Motor rated speed in Pr 00.045 (rpm) • Motor rated voltage in Pr 00.044 (V) - check if	Mot X XXXXXXXX No XXXXXXX No XXXXXXXXXX kg P55
Set maximum frequency	Enter: • Maximum frequency in Pr 00.002 (Hz)	0.02
Set acceleration / deceleration rates	 Enter: Acceleration rate in Pr 00.003 (s/100 Hz) Deceleration rate in Pr 00.004 (s/100 Hz) (If braking resistor installed, set Pr 00.015 = Fast. Also ensure Pr 10.030 and Pr 10.031 and Pr 10.061 are set correctly, otherwise premature 'Brake R Too Hot' trips may be seen). 	100Hz
Motor thermistor set-up	The motor thermistor connection is made through the drive encoder port (terminal 15). The thermistor type is selected in <i>P1 Thermistor Type</i> (03.118). The motor thermistor can be selected in Pr 03.123 . Refer to Pr 03.123 for further information.	— /
	The drive is able to perform either a stationary or a rotating autotune. The motor must be at a standstill before an autotune is enabled. A rotating autotune should be used whenever possible so the measured value of power factor of the motor is used by the drive.	
	A rotating autotune will cause the motor to accelerate up to $^2/_3$ base speed in the direction selected regardless of the reference provided. Once complete the motor will coast to a stop. The enable signal must be removed before the drive can be made to run at the required reference. The drive can be stopped at any time by removing the run signal or removing the drive enable.	↑ cos ∅
Autotune	 A stationary autotune can be used when the motor is loaded and it is not possible to uncouple the load from the motor shaft. A stationary autotune measures the stator resistance and the transient inductance in the motor. These are required for good performance in vector control modes. A stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr 00.043. A rotating autotune should only be used if the motor is uncoupled. A rotating autotune first performs a stationary autotune before rotating the motor at ²/₃ base speed in the direction selected. The rotating autotune measures the power factor of the motor. 	R _s σL _s
	To perform an autotune: Set Pr 00.040 = 1 for a stationary autotune or set Pr 00.040 = 2 for a rotating autotune Close the Drive Enable signal (terminal 2 & 6). The drive will display 'Ready'. Close the run signal (terminal 11 or 13). The upper row of the display will flash 'Auto Tune' while the drive is performing the autotune. Wait for the drive to display 'Ready' or 'Inhibit' and for the motor to come to a standstill. If the drive trips, see Chapter 12 Diagnostics on page 192. Remove the drive enable and run signal from the drive.	
Save parameters	Select 'Save Parameters' in Pr mm.000 (alternatively enter a value of 1001 in Pr mm.000) and press the red reset button or toggle the reset digital input.	
Run	Drive is now ready to run	•

7.3.4 RFC - A mode (with position feedback)

Induction motor with position feedback

For simplicity only an incremental quadrature encoder will be considered here. For information on setting up one of the other supported speed feedback devices, refer to section 7.5 Setting up a feedback device on page 69.

Action	Detail	
Before power-up	 Ensure: The drive enable signal is not given (terminal 2 & 6). Run signal is not given Motor and feedback device are connected 	X
Power-up the drive	Verify that RFC-A mode is displayed as the drive powers up. If the mode is incorrect see section 5.6 KI-Remote Keypad changing the operating mode on page 39. Ensure: Drive displays 'Inhibit' If the drive trips, see Chapter 12 Diagnostics on page 192.	[7
Set motor feedback parameters	Incremental encoder basic set-up Enter: Drive encoder type in Pr 03.038 = AB (0): Quadrature encoder Encoder power supply in Pr. 03.036 = 5 V (0), 8 V (1) or 15 V (2). NOTE If output voltage from the encoder is >5 V, then the termination resistors must be disabled Pr 03.039 to 0. Setting the encoder voltage supply too high for the encoder could result in damage to the feedback device. Drive encoder Lines Per Revolution (LPR) in Pr 03.034 (set according to encoder) Drive encoder termination resistor setting in Pr 03.039: 0 = A-A B-B Z-Z\ termination resistors enabled 1 = A-A B-B termination resistors enabled 2 = A-A B-B Z-Z\ termination resistors enabled	
Enter motor nameplate details	 Motor rated frequency in Pr 00.047 (Hz) Motor rated current in Pr 00.046 (A) Motor rated speed in Pr 00.045 (rpm) Motor rated voltage in Pr 00.044 (V) - check if	\$\frac{1}{\sum_{\text{orange}}} \frac{1}{\sum_{\text{orange}}}
Set maximum speed	Enter: Maximum speed in Pr 00.002 (rpm)	0.02
Set acceleration / deceleration rates	 Enter: Acceleration rate in Pr 00.003 (s/1000 rpm) Deceleration rate in Pr 00.004 (s/1000 rpm) (If braking resistor installed, set Pr 00.015 = Fast. Also ensure Pr 10.030, Pr 10.031 and Pr 10.061 are set correctly, otherwise premature 'Brake R Too Hot' trips may be seen). 	1000rpm
Motor thermistor set-up	The motor thermistor connection is made through the drive encoder port (terminal 15). The thermistor type is selected in <i>P1 Thermistor Type</i> (03.118). The motor thermistor can be selected in Pr 03.123 . Refer to Pr 03.123 for further information.	
Autotune	The drive is able to perform either a stationary or a rotating autotune. The motor must be at a standstill before an autotune is enabled. A stationary autotune will give moderate performance whereas a rotating autotune will give improved performance as it measures the actual values of the motor parameters required by the drive. A rotating autotune will cause the motor to accelerate up to ² / ₃ base speed in the direction selected regardless of the reference provided. Once complete the motor will coast to a stop. The enable signal must be removed before the drive can be made to run at the required reference. The drive can be stopped at any time by removing the run signal or removing the drive enable. A stationary autotune can be used when the motor is loaded and it is not possible to uncouple the load from the motor. These are used to calculate the current loop gains, and at the end of the test the values in Pr 00.038 and Pr 00.039 are updated. A stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr 00.043. A rotating autotune should only be used if the motor is uncoupled. A rotating autotune first performs a stationary autotune before rotating the motor at ² / ₃ base speed in the direction selected. The rotating autotune measures the stator inductance of the motor and calculates the power factor. To perform an autotune: Set Pr 00.040 = 1 for a stationary autotune or set Pr 00.040 = 2 for a rotating autotune Close the drive enable signal (terminal 2 & 6). The drive will display 'Ready'. Close the run signal (terminal 11 or 13). The upper row of the display will flash 'Auto Tune' while the drive is performing the autotune. Wait for the drive to display 'Ready' or 'Inhibit' and for the motor to come to a standstill lift the drive trips, see Chapter 12 Diagnostics on page 192. Remove the drive enable and run signal from the drive.	R _s dL _s L _s saturation break-points N rpm

7.3.5 RFC-A mode (Sensorless control) Induction motor with sensorless control

Action	Detail	
Before power-up	Ensure: The drive enable signal is not given (terminal 2 & 6). Run signal is not given Motor is connected	X
Power-up the drive	Verify that RFC-A mode is displayed as the drive powers up. If the mode is incorrect see section 5.6 KI-Remote Keypad changing the operating mode on page 39. Ensure: • Drive displays 'Inhibit' If the drive trips, see Chapter 12 Diagnostics on page 192.	7
Select RFC-A (Sensorless control) mode and disable encoder wire- break trip	 Set Pr 03.024 = 1 or 3 to select RFC-A Sensorless mode Set Pr 03.040 = 0000 to disable the wire break 	
Enter motor nameplate details	Enter: • Motor rated frequency in Pr 00.047 (Hz) • Motor rated current in Pr 00.046 (A) • Motor rated speed in Pr 00.045 (rpm) • Motor rated voltage in Pr 00.044 (V) - check if	May 12 CONTINUES May 12 CONT
Set maximum speed	Enter: • Maximum speed in Pr 00.002 (rpm)	0.02
Set acceleration / deceleration rates	 Enter: Acceleration rate in Pr 00.003 (s/1000rpm) Deceleration rate in Pr 00.004 (s/1000rpm) (If braking resistor installed, set Pr 00.015 = Fast. Also ensure Pr 10.030, Pr 10.031 and Pr 10.061 are set correctly, otherwise premature 'Brake R Too Hot' trips may be seen). 	1000pm
Motor thermistor set-up	The motor thermistor connection is made through the drive encoder port (terminal 15). The thermistor type is selected in <i>P1 Thermistor Type</i> (03.118). The motor thermistor can be selected in Pr 03.123 . Refer to Pr 03.123 for further information.	-
Select or deselect catch a spinning motor mode	If catch a spinning motor mode is not required then set Pr 06.009 to 0. If catch a spinning motor mode is required then leave Pr 06.009 at the default of 1, but depending on the size of the motor the value in Pr 05.040 may need to be adjusted. Pr 05.040 defines a scaling function used by the algorithm that detects the speed of the motor. The default value of Pr 05.040 is 1 which is suitable for small motors (<4 kW). For larger motors the value in Pr 05.040 will need to be increased. Approximate values of Pr 05.040 for different motor sizes are as follows, 2 for 11 kW, 3 for 55 kW and 5 for 150 kW. If the value of Pr 05.040 is too large the motor may accelerate from standstill when the drive is enabled. If the value of this parameter is too small the drive will detect the motor speed as zero even if the motor is spinning.	
	The drive is able to perform either a stationary or a rotating autotune. The motor must be at a standstill before an autotune is enabled. A stationary autotune will give moderate performance whereas a rotating autotune will give improved performance as it measures the actual values of the motor parameters required by the drive. NOTE It is highly recommended that a rotating autotune is performed (Pr 00.040 set to 2). A rotating autotune will cause the motor to accelerate up to ² / ₃ base speed in the direction selected regardless of the reference provided. Once complete the motor will coast to a stop. The enable signal must be removed before the drive can be made to run at the required reference. The drive can be stopped at any time by removing the run signal or removing the drive enable.	↑ cos Ø
Autotune	 A stationary autotune can be used when the motor is loaded and it is not possible to uncouple the load from the motor shaft. The stationary autotune measures the stator resistance and transient inductance of the motor. These are used to calculate the current loop gains, and at the end of the test the values in Pr 00.038 and Pr 00.039 are updated. A stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr 00.043. A rotating autotune should only be used if the motor is uncoupled. A rotating autotune first performs a stationary autotune before rotating the motor at 2/3 base speed in the direction selected. The rotating autotune measures the stator inductance of the motor and calculates the power factor. To perform an autotune: Set Pr 00.040 = 1 for a stationary autotune or set Pr 00.040 = 2 for a rotating autotune Close the drive enable signal (terminal 2 & 6). The drive will display 'Ready' or 'Inhibit'. Close the run signal (terminal 11or 13). The upper row of the display will flash 'Auto Tune' while the drive is performing the autotune. Wait for the drive to display 'Ready' or 'Inhibit' and for the motor to come to a standstill. If the drive trips, see Chapter 12 Diagnostics on page 192. Remove the drive enable and run signal from the drive. 	R _s od sturation break-points N rpm

7.4 Quick start commissioning / start-up using Connect

Connect is a Windows™ based software commissioning / start-up tool for Digitax HD.

Connect can be downloaded from http://www.drive-setup.com/ctdownloads

Electrical

Getting

Connect system requirements

Product

Mechanical

Safety

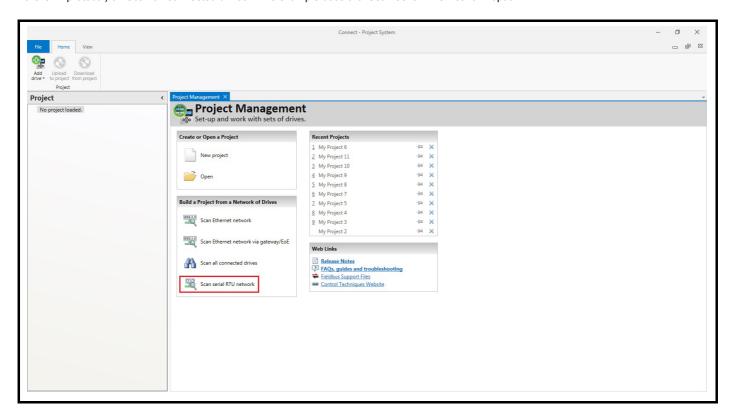

- Windows 8, Windows 7 SP1, Windows Vista SP2, Windows XP SP3
- Minimum of 1280 x 1024 screen resolution with 256 colours
- Microsoft.Net Frameworks 4.0 (this is provided in the downloaded file)
- Note that you must have administrator rights to install Connect

Any previous copy of Connect should be uninstalled before proceeding with the installation (existing projects will not be lost).

Basic

Power-up the drive

1. Start Connect, and on the 'Project Management' screen select 'Scan serial RTU network' (M751 only when connected to the drive communication port or all variants when connecting via the KI-Compact 485 adaptor), 'Scan Ethernet network' (M750 only or M753 when using Ethernet over EtherCAT protocol) or 'Scan all connected drives'. This example uses the 'Scan serial RTU network' option.

Select the discovered drive.

- 1. Select the 'Online' icon to connect with the drive. When a successful connection is made the icon will be highlighted blue.
- 2. Select 'Set mode and region'.

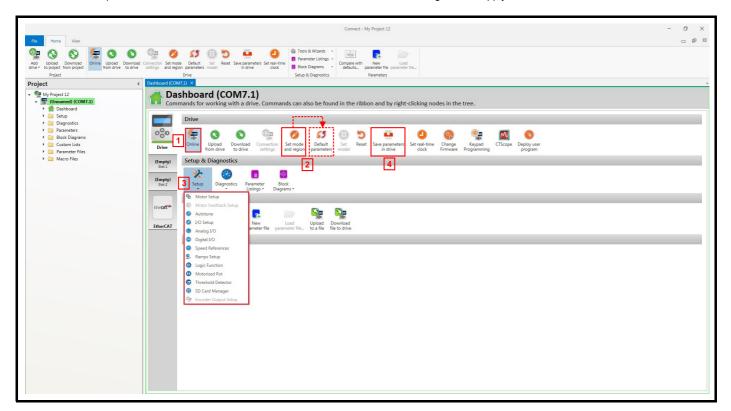

If the required control mode is highlighted in the 'Drive Settings' dialog, then:

• Change the supply frequency if required and select 'Apply', otherwise select 'Cancel'.

If the required control mode is not highlighted in the 'Drive Settings' dialog then:

- Select the required mode and supply frequency.
- Select 'Apply'.

Select 'Default parameters' from the Dashboard and in the 'Default Parameters' dialog, select 'Apply'.

3. Select 'Setup' and perform the steps highlighted:

Action	Detail
Motor set-up	Connect contains a database for induction motors and permanent magnet motors. Provision is also made to enter motor nameplate data.
Motor feedback set-up	This only needs to be performed in RFC-S and RFC-A (with feedback) modes. Enter the encoder type and encoder configuration data as prompted on screen. NOTE If output voltage from the encoder is > 5 V, then the termination resistors must be disabled Pr 03.039 to 0.
Motor recuback set up	Setting the encoder voltage supply too high for the encoder could result in damage to the feedback device.
Speed references	Enter preset speeds or a jog reference if required.
Ramps set-up	Enter the required Acceleration rate and Deceleration rate. Note: If a braking resistor is installed, set 'Ramp mode' to 'Fast'. Also ensure Pr 10.030 and Pr 10.031 and Pr 10.061 are set correctly, otherwise premature 'Brake R Too Hot' trips may be seen.
I/O set-up	Map I/O terminals to parameters (where non default configuration is required).
Analog I/O	Configure Analog input 1 and thermal monitoring parameters (where non default configuration is required).
Digital I/O	Allocate non default digital control functions to digital terminals where necessary.
Autotune	Follow the Autotune set up wizard to automatically tune the drive to the motor. NOTE Not required when using data from the motor database for a Leroy Somer LSRPM motor used in RFC-S Sensorless mode.

4. Select 'Save parameters in drive' to perform a parameter save. The drive is now ready to run.

UVW commutation signal only encoders*						
Device Type (03.038)	Commutation Only (16) for a quadrature encoder with commutation signals*					
Supply Voltage (03.036)	5 V (0), 8 V (1) or 15 V (2)					
Error Detection Level (03.040)	Set to zero to disable wire break detection					

^{*} This feedback device provides very low resolution feedback and should not be used for applications requiring a high level of performance.

Due to the low resolution of UVW communication only encoders, it is recommended that the *P1 Feedback Filter* (03.042) is set to its maximum value. A value of 1 ms to 2 ms may also be required in the *Current Reference Filter* (00.017) and it is also recommended that the speed loop gains are set to a low value to obtain stable operation.

Resolver									
Device Type (03.038)	Resolver (14)								
Resolver Poles (03.065)	Set number of Resolver poles poles (1) to 20 poles (10)								
Resolver Excitation (03.066)	Set Resolver excitation voltage and frequency 6 kHz 3V (0), 8 kHz 3V (1), 6 kHz 2V (2), 8 kHz 2V (3)								
Error Detection Level (03.040)	Bit Description								
	x x 1 Enable wire break detection								
	1 X X Disable trips Encoder 1 to Encoder 6								
	So for example, to enable the wire break error detection, set Pr 03.040 to 0001.

7.5.3 P2 position interface

This section shows the parameter settings which must be made to use each of the compatible feedback device types with the P2 position interface on the drive. For more information on the parameters listed here please refer to the *Parameter Reference Guide*. If the position feedback device connected to the P2 position interface is required to be used for motor control feedback then Pr **03.026** will need to be set to P2 Drive (1).

Table 7-4 Parameters required for feedback device set-up on the P2 position interface

Parameter	AB, FD, FR	EnDat	SSI	BiSS
P2 Marker Mode (03.131)	✓			
P2 Rotary Turns Bits (03.133)		•	•	•
P2 Rotary Lines Per Revolution (03.134)	✓	•	•	•
P2 Comms Bits (03.135)		•	•	•
P2 Comms Baud Rate (03.137)		✓	✓	✓
P2 Device Type (03.138)	✓	✓	✓	✓
P2 Auto-configuration Select (03.141)		✓		✓

[✓] Information required to be entered by the user.

Parameter can be set-up automatically by the drive through auto-configuration. Parameter must be set by the user if auto-configuration is
disabled (i.e. Pr 03.141 = Disabled (0)).

The P2 position interface does not have its own independent power supply output. Therefore, any position feedback device connected to the P2 position interface must either share the P1 power supply output on pin 13 of the 15-way D-type, or be supplied from an external source.

NOTE

The termination resistors are always enabled on the P2 position interface. Wire break detection is not available when using AB, FD or FR position feedback device types on the P2 position interface.

Table 7-4 shows a summary of the parameters required to set-up each feedback device. More detailed information follows.

7.6 Encoder Simulation Output Set-up

The drive supports four modes of encoder simulation output.

- Hardware mode Incremental signals (AB, FD, FR)
- Software mode Incremental signals (AB, FD, FR)
- Software mode Ratio
- · Software mode Absolute SSI data

The availability of the encoder simulation output on the 15-way D-type on the drive is dependent on the type of feedback device connected to the P1 position interface. See Table 4-8 on page 25 for more information on the availability of the encoder simulation output. The status of the encoder simulation output can be seen in *Encoder Simulation Status* (03.086) as follows:

None (0) The encoder simulation output is not enabled or is not available

Full (1) Full encoder simulation with marker output is available No Marker (2) Encoder simulation without marker output is available

This section shows the parameter settings which must be made to use the encoder simulation output on the drive. For more information on the parameters listed here please refer to the Parameter Reference Guide.

7.6.1 Hardware mode - Incremental signals (AB, FD, or FR)

Hardware mode provides incremental signals derived via hardware from the P1 position feedback interface on the drive, with negligible delay. The supported incremental output signals are AB, FD and FR. Hardware mode only produces an output when the input device connected to the P1 position interface is AB, FD, FR, SC, SC Hiperface, SC EnDat or SC SSI type devices. It should be noted that with a SINCOS source device the output is based on the zero crossings of the sine wave inputs and does not include interpolation.

Hardware mode set-up	
Encoder Simulation Source (03.085)	This parameter must be set to 03.029 to select the P1 position interface as the source.
Encoder Simulation Mode (03.088)	Set to a value of Hardware (0)
Encoder Simulation Hardware Divider (03.089)	This parameter defines the divider ratio between the device connected to the P1 position feedback interface and the output. 0 = 1/1 1 = 1/2 2 = 1/4 3 = 1/8 4 = 1/16 5 = 1/32 6 = 1/64 7 = 1/128
Encoder Simulation Hardware Marker Lock (03.090)	 0 = The marker output is derived directly from the marker input 1 = The incremental output signals are adjusted on each marker event so that the A and B are high with an AB type output, or F is high with an FD or FR type output
Encoder Simulation Output Mode (03.098)	AB/Gray (0) for a AB quadrature output signals FD/Binary (1) for Frequency and Direction output signals FR/Binary (2) for Forward and Reverse output signals

7.6.2 Software mode - Incremental signals (AB, FD, or FR)

In software mode the encoder simulation output is derived via software from the selected source with a minimum delay of 250 μ s which may be extended with *Encoder Simulation Sample Period* (03.087). For incremental output signals, the resolution of the output can be defined by either selecting the required output lines per revolution or by an output ratio.

Lines per revolution

The output resolution of the encoder simulation output is defined by Encoder Simulation Output Lines Per Revolution (03.092).

AB quadrature output signals, software mode setup – Lines per revolution									
Encoder Simulation Source (03.085)	Set to the parameter number of the position source Pr 03.029 to use the P1 position interface on the drive as the source. Pr 03.129 to use the P2 position interface on the drive as the source. This parameter can be set to any other valid position reference generated by the drive or an option module.								
Encoder Simulation Mode (03.088)	Set to a value of Lines Per Rev (1)								
Encoder Simulation Output Lines Per Revolution (03.092)	Set to the required output lines per revolution. The maximum output lines per revolution are 16384.								
Encoder Simulation Output Mode (03.098)	AB/Gray (0) for a AB quadrature output signals								

Frequency and Direction or Forward and	Frequency and Direction or Forward and Reverse output signals, software mode setup – Lines per revolution										
Encoder Simulation Source (03.085)	Set to the parameter number of the position source Pr 03.029 to use the P1 position interface on the drive as the source. Pr 03.129 to use the P2 position interface on the drive as the source. This parameter can be set to any other valid position reference generated by the drive or an option module.										
Encoder Simulation Mode (03.088)	Set to a value of Lines Per Rev (1)										
Encoder Simulation Output Lines Per Revolution (03.092)	Set to the required output pulse per revolution divided by 2. For example if 2000 pulses per revolution is required, set this parameter to 1000.										
Encoder Simulation Output Mode (03.098)	FD/Binary (1) for Frequency and Direction output signals FR/Binary (2) for Forward and Reverse output signals

Ratio

In ratio mode the resolution of the input source is based on a 16 bit position feedback device (i.e. equivalent to an AB quadrature encoder with a resolution of 16384 lines per revolution). The output resolution of the encoder simulation output is defined by the ratio of *Encoder Simulation Numerator* (03.093) and *Encoder Simulation Denominator* (03.094).

AB quadrature output signals, software mode setup – Ratio Frequency and Direction or Forward and Reverse output signals, software mode setup						
Set to the parameter number of the position source. Pr 03.029 to use the P1 position interface on the drive as the source. Pr 03.129 to use the P2 position interface on the drive as the source. This parameter can be set to any other valid position reference generated by the driven module.						
Encoder Simulation Mode (03.088)	Set to a value of Ratio (2)					
Encoder Simulation Numerator (03.093) and Encoder Simulation Denominator (03.094)	Set these two parameters to give the required output ratio.					
Encoder Simulation Output Mode (03.098)	AB/Gray (0) for a AB quadrature output signals FD/Binary (1) for Frequency and Direction output signals FR/Binary (2) for Forward and Reverse output signals					

Software mode - Absolute SSI data

In software mode the encoder simulation output is derived via software from the selected source with a minimum delay of 250 μ s which may be extended with *Encoder Simulation Sample Period* (03.087). In SSI output mode drive will simulate an SSI encoder, where the number of bits and the format of the position message can be adjusted.

Absolute SSI data, software mode setup						
Encoder Simulation Source (03.085)	Set to the parameter number of the position source. Pr 03.029 to use the P1 position interface on the drive as the source. Pr 03.129 to use the P2 position interface on the drive as the source. This parameter can be set to any other valid position reference generated by the drive or an option module.					
Encoder Simulation Mode (03.088)	Set to a value of SSI (3)					
Encoder Simulation SSI Turns Bits (03.096)	Set to the number of bits representing the number of turns in the position message.					
Encoder Simulation SSI Comms Bits (03.097)	Set to the number bits in the whole position message.					
Encoder Simulation Output Mode (03.098)	AB/Gray (0) for position data in Gray code format FD/Binary (1) or FR/Binary (2) for position data in binary format

8 Optimization

This chapter takes the user through methods of optimizing the drive set-up and maximize the performance. The auto-tuning features of the drive simplify the optimization tasks.

8.1 Motor map parameters

8.1.1 RFC-S mode

Permanent magnet motor with Position feedback

Pr 00.046 {05.007} Rated Current

Defines the maximum motor continuous current

The motor rated current parameter must be set to the maximum continuous current of the motor. The motor rated current is used in the following:

- Current limits (see section 8.2 Current limits on page 92, for more information)
- Motor thermal overload protection (see section 8.3 Motor thermal protection on page 92, for more information)

Pr 00.042 {05.011} Number Of Motor Poles

Defines the number of motor poles

The number of motor poles parameter defines the number of electrical revolutions in one whole mechanical revolution of the motor. This parameter must be set correctly for the control algorithms to operate correctly. When Pr 00.042 is set to "Automatic" the number of poles is 6.

Pr 00.040 {05.012} Autotune

There are four autotune tests available in RFC-S mode, a stationary autotune, a rotating autotune, mechanical load measurement tests to measure load dependent parameters

Stationary Autotune

The stationary autotune can be used when the motor is loaded and it is not possible uncouple the load from motor shaft. This test can be used to measure all the necessary parameters for basic control. During the stationary autotune, a test is performed to locate the flux axis of the motor. However this test may not be able to calculate such an accurate value for the *Position Feedback Phase Angle* (00.043) as compared to rotating autotune. A stationary test is performed to measure *Stator Resistance* (05.017), *Ld* (05.024), *Maximum Deadtime Compensation* (05.059), *Current At Maximum Deadtime Compensation* (05.060), *No Load Lq* (05.072). If *Enable Stator Compensation* (05.049) = 1 then *Stator Base Temperature* (05.048) is made equal to *Stator Temperature* (05.046). The Stator Resistance (05.017) and the Ld (05.024) are then used to set up Current controller Kp Gain (00.038) and Current Controller Ki Gain (00.039). If sensorless mode is not selected then Position Feedback Phase Angle (00.043) is set up for the position from the position feedback interface selected with Motor Control Feedback Select (03.026). To perform a Stationary autotune, set Pr **00.040** to 1, and provide the drive with both an enable signal (terminal 2 and 6) and a run signal (terminal 11 or 13).

Rotating Autotune

The rotating autotune must be performed on unloaded motor. This test can be used to measure all the necessary parameters for the basic control and

parameters for cancelling the effects of the cogging torque.

During the rotating autotune, *Rated Current* (00.046) is applied and the motor is rotated by 2 electrical revolutions (i.e. up to 2 mechanical revolutions) in the required direction. If sensorless mode is not selected then the Position Feedback Phase Ángle (00.043) is set-up for the position from the position feedback interface selected with Motor Control Feedback Select (03.026). A stationary test is then performed to measure Stator Resistance (05.017), Ld (05.024) Maximum Deadtime Compensation (05.059), Current At Maximum Deadtime Compensation (05.060) and No Load Lq (05.072). Stator Resistance (05.017) and Ld (05.024) are used to set up Current Controller Kp Gain (00.038) and Current Controller Ki Gain (00.039). This is only done once during the test, and so the user can make further adjustments to the current controller gains if required. To perform a Rotating autotune, set Pr 00.040 to 2, and provide the drive with both an enable signal (terminal 2 & 6) and a run signal (terminal 11 or 13)

Mechanical load measurement test using signal injection

The mechanical load measurement test using signal injection, measures the mechanical characteristic of the motor and load by rotating the motor at the speed defined by the present speed reference and injecting a series of speed test signals. This test should only be used provided all the basic control parameters (including Torque Per Amp (05.032)) have been set-up correctly and the speed controller parameters should be set to conservative levels, such as the default values, so that the motor is stable when it runs. The test measures the motor and load inertia, which can be used in automatic set-up of the speed controller gains and in producing a torque feed-forward term. If *Mechanical Load Test Level* (05.021) is left at its default value of zero then the peak level of the injection signal will be 1 % of the maximum speed reference subject to a maximum of 500 rpm. If a different test level is required then *Mechanical* Load Test Level (05.021) should be set to a non-zero value to define the level as a percentage of the maximum speed reference, again subject to a maximum of 500 rpm. The user defined speed reference which defines the speed of the motor should be set to a level higher than the test level, but not high enough for necessary to increase the test signal from the default value. The test will give the correct results when there is a static load applied to the motor and in the presence of mechanical damping. This test should be used if possible, however for sensorless mode, or if the speed controller cannot be set up for stable operation an alternative test is provided (*Autotune* (00.040) = 4) where a series of torque levels are applied to accelerate and decelerate the motor to measure the inertia. flux weakening to become active. In some cases, however it is possible to perform the test at zero speed provided the motor is free to move, but it may be

1. A rotating test is performed in which the motor is accelerated with the currently selected ramps up to the currently selected speed reference, and this speed is maintained for the duration of the test. *Motor And Load Inertia* (03.018) and *Inertia Times* 1000 (04.033) are set up.

To perform this autotune test, set Pr 00.040 to 3 and provide the drive with both an enable signal (terminal 2 and 6) and a run signal (terminal 11 or 13).

 Mechanical load measurement using applied torque

Auto-tune test 3 should normally be used for mechanical load measurement, but under some circumstances this test may be used as an alternative. This test is likely to give incorrect results if standard ramp mode is active. A series of progressively larger torque levels are applied to the motor (20 %, 40 % ... 100 % of rated torque) to accelerate the motor up to 3/4 x Rated Speed (00.045) to determine the inertia from the acceleration/deceleration time. The test attempts to reach the required speed within 5s, but if this fails the next torque level is used. When 100 % torque is used the test allows 60 s for the required speed to be reached, but if this is unsuccessful, a trip is initiated. To reduce the time taken for the test it is possible to define the level of torque to be used for the test by setting Mechanical Load Test Level (05.021) to a non-zero value. When the test level is defined the test is only carried out at the defined test level and 60 s is allowed for the motor to reached the required speed. It should be noted that if the maximum speed allows for flux weakening then it may not be possible to achieve the required torque level to accelerate the motor fast enough. If this is the case, the maximum speed reference should be reduced

- 1. The motor is accelerated in the required direction up to 3/4 of the maximum speed reference and then decelerated to zero speed.
- The test is repeated with progressively higher torques until the required speed is reached.
 Motor And Load Inertia (03.018) and Inertia Times 1000 (04.033) are set up. To perform this autotune test, set Pr 00.040 to 4 and provide the drive with both an enable signal (terminal 2 and 6) and a run signal (terminal 11 or 13).

Pr 00.038 {04.013} / Pr 00.039 {04.014} Current Loop Gains

The current loop gains proportional (Kp) and integral (Ki) gains control the response of the current loop to a change in current (torque) demand. The default values give satisfactory operation with most motors. However, for optimal performance in dynamic applications it may be necessary to change the gains to improve the performance. The proportional gain (Pr 00.038) is the most critical value in controlling the performance. The values for the current loop gains can be calculated by performing a stationary or rotating autotune (see *Autotune* Pr 00.040, earlier in this table) the drive measures the *Stator Resistance* (05.017) and *Transient Inductance* (05.024) of the motor and calculates the current loop gains.

This will give a step response with minimum overshoot after a step change of current reference. The proportional gain can be increased by a factor of 1.5 giving a similar increase in bandwidth; however, this gives a step response with approximately 12.5 % overshoot. The equation for the integral gain gives a conservative value. In some applications where it is necessary for the reference frame used by the drive to dynamically follow the flux very closely (i.e. high speed Sensorless RFC-A induction motor applications) the integral gain may need to have a significantly higher value.

Speed loop gains (Pr 00.007 {03.010}, Pr 00.008 {03.011}, Pr 00.009 {03.012})

The speed loop gains control the response of the speed controller to a change in speed demand. The speed controller includes proportional (Kp) and integral (Ki) feed forward terms, and a differential (Kd) feedback term. The drive holds two sets of these gains and either set may be selected for use by the speed controller with Pr 03.016. If Pr 03.016 = 0, gains Kp1, Ki1 and Kd1 (Pr 00.007 to Pr 00.009) are used, and if Pr 03.016 = 1, gains Kp2, Ki2 and Kd2 (Pr 03.013 to Pr 03.015) are used. Pr 03.016 may be changed when the drive is enabled or disabled. If the load is predominantly a constant inertia and constant torque, the drive can calculate the required Kp and Ki gains to give a required compliance angle or bandwidth dependant on the setting of Pr 03.017.

Speed Controller Proportional Gain (Kp), Pr 00.007 {03.010} and Pr 03.013

If the proportional gain has a value and the integral gain is set to zero the controller will only have a proportional term, and there must be a speed error to produce a torque reference. Therefore as the motor load increases there will be a difference between the reference and actual speeds. This effect, called regulation, depends on the level of the proportional gain, the higher the gain the smaller the speed error for a given load. If the proportional gain is too high either the acoustic noise produced by speed feedback quantization becomes unacceptable, or the stability limit is reached.

Speed Controller Integral Gain (Ki), Pr 00.008 (03.011) and Pr 03.014

The integral gain is provided to prevent speed regulation. The error is accumulated over a period of time and used to produce the necessary torque demand without any speed error. Increasing the integral gain reduces the time taken for the speed to reach the correct level and increases the stiffness of the system, i.e. it reduces the positional displacement produced by applying a load torque to the motor. Unfortunately increasing the integral gain also reduces the system damping giving overshoot after a transient. For a given integral gain the damping can be improved by increasing the proportional gain. A compromise must be reached where the system response, stiffness and damping are all adequate for the application.

Differential Gain (Kd), Pr 00.009 {03.012} and Pr 03.015

The differential gain is provided in the feedback of the speed controller to give additional damping. The differential term is implemented in a way that does not introduce excessive noise normally associated with this type of function. Increasing the differential term reduces the overshoot produced by under-damping, however, for most applications the proportional and integral gains alone are sufficient.

Safety Product Mechanical Electrical Getting Basic Running information installation installation started parameters Termination Information Informatio

Speed loop gains (cont) (Pr 00.007 {03.010}, Pr 00.008 {03.011}, Pr 00.009 {03.012})

There are three methods of tuning the speed loop gains dependant on the setting of Pr 03.017:

1. Pr **03.017** = 0, User set-up.

This involves the connecting of an oscilloscope to analog output 1 to monitor the speed feedback.

Give the drive a step change in speed reference and monitor the response of the drive on the oscilloscope.

The proportional gain (Kp) should be set up initially. The value should be increased up to the point where the speed overshoots and then reduced slightly.

The integral gain (Ki) should then be increased up to the point where the speed becomes unstable and then reduced slightly.

It may now be possible to increase the proportional gain to a higher value and the process should be repeated until the system response matches the ideal response as shown.

The diagram shows the effect of incorrect P and I gain settings as well as the ideal response.

2. Pr **03.017** = 1, Bandwidth set-up

If bandwidth based set-up is required, the drive can calculate Kp and Ki if the following parameters are set up correctly:

Pr 03.020 - Required bandwidth,

Pr 03.021 - Required damping factor,

Pr 03.018 - Motor and load inertia.

The drive can be made to measure the motor and load inertia by performing a mechanical load measurement autotune (see *Autotune* Pr 00.040, earlier in this table).

3. Pr 03.017 = 2, Compliance angle set-up

If compliance angle based set-up is required, the drive can calculate Kp and Ki if the following parameters are set up correctly:

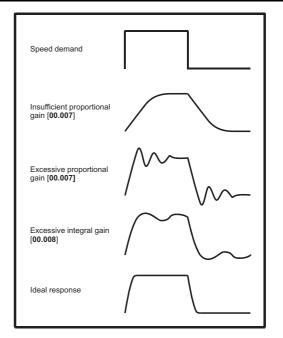

Pr 03.019 - Required compliance angle,

Pr 03.021 - Required damping factor,

Pr **03.018** - Motor and load inertia The drive can be made to measure the motor and load inertia by performing a mechanical load autotune (see *Autotune* Pr 00.040, earlier in this table).

4. Pr **03.017** = 3, Kp gains times 16

If Speed Controller Set-up Method (03.017) = 3 the selected proportional gain used by the drive is multiplied by 16.

5. Pr **03.017** = 4 - 6

If Speed Controller Set-up Method (03.017) is set to a value from 4 to 6 the Speed Controller Proportional Gain Kp1 (03.010) and Speed Controller Integral Gain Ki1 (03.011) are automatically set up to give the bandwidths given in the table below and a damping factor of unity. These settings give low, standard or high performance.

Speed Controller Set-up Method (03.017)	Performance	Bandwidth
4	Low	5 Hz
5	Standard	25 Hz
6	High	100 Hz

6. Pr **03.017** = 7

If Speed Controller Set-up Method (03.017) = 7 then Speed Controller Proportional Gain Kp1 (03.010), Speed Controller Integral Gain Ki1 (03.011) and Speed Controller Differential Feedback Gain Kd1 (03.012) are set up to give a closed-loop speed controller response that approximates to a first order system with a transfer function of 1 / (s τ + 1), where τ = 1/ ω bw and ω bw = 2 π x Bandwidth (03.020). In this case the damping factor is meaningless, and Damping Factor (03.021) and Compliance Angle (03.019) have no effect.

8.1.2 RFC-S Sensorless mode

Permanent magnet motor without Position feedback

Pr 00.046 {05.007} Rated Current

Defines the maximum motor continuous current

The motor rated current parameter must be set to the maximum continuous current of the motor. The motor rated current is used in the following:

- Current limits (see section 8.2 Current limits on page 92, for more information)
- Motor thermal overload protection (see section 8.3 Motor thermal protection on page 92, for more information)

Pr 00.042 {05.011} Number Of Motor Poles

Defines the number of motor poles

The number of motor poles parameter defines the number of electrical revolutions in one whole mechanical revolution of the motor. This parameter must be set correctly for the control algorithms to operate correctly. When Pr **00.042** is set to "Automatic" the number of poles is 6.

Pr 00.040 {05.012} Autotune

There are three autotune tests available in RFC-S sensorless mode, a stationary autotune and an inertia measurement test.

Stationary Autotune (Pr 00.040 {05.012} = 1)

The stationary autotune can be used to measure all the necessary parameters for basic control. The tests measures *Stator Resistance* (05.017), *Ld* (05.024), *No Load Lq* Pr **00.056 (05.072)**, *Maximum Deadtime Compensation* (05.059) and *Current At Maximum Deadtime Compensation* (05.060). If *Enable Stator Compensation* (05.049) = 1 then *Stator Base Temperature* (05.048) is made equal to *Stator Temperature* (05.046). *The Stator Resistance* (05.017) and *Ld* (05.024) are then used to set up *Current controller Kp Gain* Pr **00.038 (04.013)** and *Current Controller Ki Gain* Pr **00.039 (04.014)**. To perform a Stationary autotune, set Pr **00.040** to 1, and provide the drive with both an enable signal (terminal 2 & 6) and a run signal (terminal 11 or 13).

Rotating Autotune (Pr 00.040 {05.012} = 2)

In sensorless mode, if Rotating autotune is selected (Pr 00.040 = 2), then a stationary autotune is performed.

Inertia measurement test (Pr 00.040 {05.012} = 4)

NOTE: It is not possible to perform this test if, after autotune, the ratio *No load Lq* Pr **00.056** {**05.072**} / *Ld* (05.024) < 1.1 and Pr **00.054** {**05.064**} has been set to Non-salient.

The inertia measurement test can measure the total inertia of the load and the motor. This is used to set the speed loop gains (see Speed loop gains) and to provide torque feed-forwards when required during acceleration. The test may give inaccurate results, if the motor rated speed is not set to the correct value for the motor, or if standard ramp mode is active. During the inertia measurement test a series of progressively larger torque levels are applied to the motor (20 %, 40 % ... 100 % of rated torque) to accelerate the motor up to 3/4 x Rated Speed Pr 00.045 {05.008} to determine the inertia from the acceleration/ deceleration time. The test attempts to reach the required speed within 5 s, but if this fails the next torque level is used. When 100 % torque is used the test allows 60 s for the required speed to be reached, but if this is unsuccessful an Autotune trip is initiated. To reduce the time taken for the test it is possible to define the level of torque to be used for the test by setting Mechanical Load Test Level (05.021) to a non-zero value. When the test level is defined the test is only carried out at the defined test level and 60 s is allowed for the motor to reach the required speed. It should be noted that if the maximum speed allows for flux weakening then it may not be possible to achieve the required torque level to accelerate the motor quickly enough. If this is the case, the maximum speed reference should be reduced. To perform an Inertia measurement autotune, set Pr 00.040 to 4, and provide the drive with both an enable signal (on terminal 2 & 6) and a run signal (on terminal 11 or 13).

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the Safe Torque Off signal from terminal 2 & 6, setting the drive Enable Parameter (06.015) to Off (0) or disabling the drive via the control word (Pr 06.042 & Pr 06.043).

Pr 00.038 {04.013} / Pr 00.039 {04.014} Current Loop Gains

The current loop gains proportional (Kp) and integral (Ki) gains control the response of the current loop to a change in current (torque) demand. The default values give satisfactory operation with most motors. However, for optimal performance in dynamic applications it may be necessary to change the gains to improve the performance. The proportional gain Pr 00.038 {04.013} is the most critical value in controlling the performance. The values for the current loop gains can be calculated by performing a stationary or rotating autotune (see *Autotune* Pr 00.040, earlier in this table) the drive measures the *Stator Resistance* (05.017) and *Transient Inductance* (05.024) of the motor and calculates the current loop gains.

This will give a step response with minimum overshoot after a step change of current reference. The proportional gain can be increased by a factor of 1.5 giving a similar increase in bandwidth; however, this gives a step response with approximately 12.5 % overshoot. The equation for the integral gain gives a conservative value. In some applications where it is necessary for the reference frame used by the drive to dynamically follow the flux very closely the integral gain may need to have a significantly higher value.

Safety Product Mechanical Electrical Getting Basic Running SD Card Onboard Advanced **UL** listing Optimization Diagnostics nformatio installation parameters Operation PLC parameters

Speed Loop Gains (Pr 00.007 {03.010}, Pr 00.008 {03.011}, Pr 00.009 {03.012})

The speed loop gains control the response of the speed controller to a change in speed demand. The speed controller includes proportional (Kp) and integral (Ki) feed forward terms, and a differential (Kd) feedback term. The drive holds two sets of these gains and either set may be selected for use by the speed controller with Pr 03.016. If Pr 03.016 = 0, gains Kp1, Ki1 and Kd1 (Pr 00.007 to Pr 00.009) are used, and if Pr 03.016 = 1, gains Kp2, Ki2 and Kd2 (Pr 03.013 to Pr 03.015) are used. Pr 03.016 may be changed when the drive is enabled or disabled. If the load is predominantly a constant inertia and constant torque, the drive can calculate the required Kp and Ki gains to give a required compliance angle or bandwidth dependant on the setting of Pr 03.017.

NOTE: In sensorless mode, the speed controller bandwidth may need to be limited to 10 Hz or less for stable operation.

Speed Controller Proportional Gain (Kp), Pr 00.007 (03.010) and Pr 03.013

If the proportional gain has a value and the integral gain is set to zero the controller will only have a proportional term, and there must be a speed error to produce a torque reference. Therefore as the motor load increases there will be a difference between the reference and actual speeds. This effect, called regulation, depends on the level of the proportional gain, the higher the gain the smaller the speed error for a given load. If the proportional gain is too high either the acoustic noise produced by speed feedback quantization becomes unacceptable, or the stability limit is reached.

Speed Controller Integral Gain (Ki), Pr 00.008 (03.011) and Pr 03.014

The integral gain is provided to prevent speed regulation. The error is accumulated over a period of time and used to produce the necessary torque demand without any speed error. Increasing the integral gain reduces the time taken for the speed to reach the correct level and increases the stiffness of the system, i.e. it reduces the positional displacement produced by applying a load torque to the motor. Unfortunately increasing the integral gain also reduces the system damping giving overshoot after a transient. For a given integral gain the damping can be improved by increasing the proportional gain. A compromise must be reached where the system response, stiffness and damping are all adequate for the application. For RFC-S Sensorless mode, it is unlikely that the integral gain can be increased much above 0.50.

Differential Gain (Kd), Pr 00.009 (0 3.012) and Pr 03.015

The differential gain is provided in the feedback of the speed controller to give additional damping. The differential term is implemented in a way that does not introduce excessive noise normally associated with this type of function. Increasing the differential term reduces the overshoot produced by under-damping, however, for most applications the proportional and integral gains alone are sufficient.

There are six methods of tuning the speed loop gains dependant on the setting of Pr 03.017:

1. Pr **03.017** = 0, User set-up.

This involves the connecting of an oscilloscope to analog output 1 to monitor the speed feedback.

Give the drive a step change in speed reference and monitor the response of the drive on the oscilloscope.

The proportional gain (Kp) should be set up initially. The value should be increased up to the point where the speed overshoots and then reduced slightly.

The integral gain (Ki) should then be increased up to the point where the speed becomes unstable and then reduced slightly.

It may now be possible to increase the proportional gain to a higher value and the process should be repeated until the system response matches the ideal response as shown.

The diagram shows the effect of incorrect P and I gain settings as well as the ideal response.

2. Pr 03.017 = 1, Bandwidth set-up

If bandwidth based set-up is required, the drive can calculate Kp and Ki if the following parameters are set up correctly:

Pr 03.020 - Required bandwidth,

Pr 03.021 - Required damping factor,

Pr 03.018 - Motor and load inertia.

The drive can be made to measure the motor and load inertia by performing an inertia measurement autotune (see Autotune Pr 00.040, earlier in this table).

3. Pr 03.017 = 2, Compliance angle set-up

If compliance angle based set-up is required, the drive can calculate Kp and Ki if the following parameters are set up correctly:

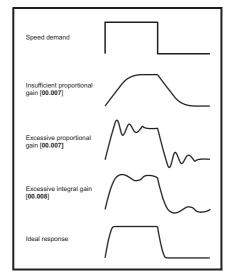

Pr 03.019 - Required compliance angle,

Pr **03.021** - Required damping factor,

Pr **03.018** - Motor and load inertia The drive can be made to measure the motor and load inertia by performing an inertia measurement autotune (see *Autotune* Pr 00.040, earlier in this table).

4. Pr **03.017** = 3, Kp gains times 16

If Speed Controller Set-up Method (03.017) = 3 the selected proportional gain used by the drive is multiplied by 16.

5. Pr **03.017** = 4 - 6

If Speed Controller Set-up Method (03.017) is set to a value from 4 to 6 the Speed Controller Proportional Gain Kp1 Pr 00.007 (03.010) and Speed Controller Integral Gain Ki1 Pr 00.008 (03.011) are automatically set up to give the bandwidths given in the table below and a damping factor of unity. These settings give low, standard or high performance.

Pr 03.017	Performance	Bandwidth
4	Low	5 Hz
5	Standard	25 Hz
6	High	100 Hz

6. Pr **03.017** = 7

If Speed Controller Set-up Method (03.017) = 7 then Speed Controller Proportional Gain Kp1 Pr 00.007 (03.010), Speed Controller Integral Gain Ki1 Pr 00.008 (03.011) and Speed Controller Differential Feedback Gain Kd1 Pr 00.009 (03.012) are set up to give a closed-loop speed controller response that approximates to a first order system with a transfer function of 1 / (st + 1), where t= 1/wbw and wbw = 2p x Bandwidth (03.020). In this case the damping factor is meaningless, and Damping Factor (03.021) and Compliance Angle (03.019) have no effect.

Safety Product Mechanical Electrical Getting Basic Running SD Card Advanced **UL** listing Onboard Optimization Diagnostics informatio information installation started parameters the motor Operation **PLC** parameters

8.1.3 Open loop motor control

Pr 00.046 {05.007} Rated Current

Defines the maximum continuous motor current

- · The rated current parameter must be set to the maximum continuous current of the motor. The motor rated current is used in the following:
- Current limits (see section 8.2 Current limits on page 92, for more information)
- Motor thermal overload protection (see section 8.3 Motor thermal protection on page 92, for more information)
- Vector mode voltage control (see Open Loop Control Mode (00.007), later in this table)
- Slip compensation (see Enable Slip Compensation (05.027), later in this table)
- Dynamic V/F control

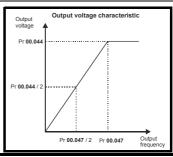

Pr 00.044 {05.009} Rated Voltage

Pr 00.047 {05.006} Rated Frequency

Defines the voltage applied to the motor at rated frequency

Defines the frequency at which rated voltage is applied

The Rated Voltage (00.044) and the Rated Frequency (00.047) are used to define the voltage to frequency characteristic applied to the motor (see Open Loop Control Mode (00.007), later in this table). The Rated Frequency (00.047) is also used in conjunction with the motor rated speed to calculate the rated slip for slip compensation (see Rated Speed (00.045), later in this table).

Pr 00.045 {05.008} Rated Speed

Pr 00.042 {05.011} Number Of Motor Poles

Defines the full load rated speed of the motor

Defines the number of motor poles

The motor rated speed and the number of poles are used with the motor rated frequency to calculate the rated slip of induction machines in Hz.

Rated slip (Hz) = Motor rated frequency - (Number of pole pairs x [Motor rated speed / 60]) = $00.047 = \left(\frac{00.042}{2} \times \frac{00.045}{60}\right)$

If Pr **00.045** is set to 0 or to synchronous speed, slip compensation is disabled. If slip compensation is required this parameter should be set to the nameplate value, which should give the correct rpm for a hot machine. Sometimes it will be necessary to adjust this when the drive is commissioned because the nameplate value may be inaccurate. Slip compensation will operate correctly both below base speed and within the field-weakening region. Slip compensation is normally used to correct for the motor speed to prevent speed variation with load. The rated load rpm can be set higher than synchronous speed to deliberately introduce speed droop. This can be useful to aid load sharing with mechanically coupled motors.

Pr 00.042 is also used in the calculation of the motor speed display by the drive for a given output frequency. When Pr 00.042 is set to 'Automatic', the number of motor poles is automatically calculated from the rated frequency Pr 00.047, and the motor rated speed Pr 00.045.

Number of poles = 120 x (Rated Frequency (00.047) / Rated Speed (00.045)) rounded to the nearest even number.

Pr 00.043 {05.010} Rated Power Factor

Defines the angle between the motor voltage and current

The power factor is the true power factor of the motor, i.e. the angle between the motor voltage and current. The power factor is used in conjunction with the *Rated Current* (00.046), to calculate the rated active current and magnetising current of the motor. The rated active current is used extensively to control the drive, and the magnetising current is used in vector mode stator resistance compensation. It is important that this parameter is set up correctly. The drive can measure the motor rated power factor by performing a rotating autotune (see Autotune (Pr 00.040), overleaf).

Pr 00.040 {05.012} Autotune

There are two autotune tests available in open loop mode, a stationary and a rotating test. A rotating autotune should be used whenever possible so the measured value of power factor of the motor is used by the drive.

- A stationary autotune can be used when the motor is loaded and it is not possible to remove the load from the motor shaft. The stationary test measures
 the Stator Resistance (05.017), Transient Inductance (05.024), Maximum Deadtime Compensation (05.059) and Current At Maximum Deadtime
 Compensation (05.060) which are required for good performance in vector control modes (see Open Loop Control Mode (00.007), later in this table).
 The stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr 00.043. To perform
 a Stationary autotune, set Pr 00.040 to 1, and provide the drive with both an enable signal (terminal 2 & 6) and a run signal (terminal 11 or 13).
- A rotating autotune should only be used if the motor is unloaded. A rotating autotune first performs a stationary autotune, as above, then a rotating test is performed in which the motor is accelerated with currently selected ramps up to a frequency of Rated Frequency (05.006) x 2/3, and the frequency is maintained at that level for 4 seconds. Stator Inductance (05.025) is measured and this value is used in conjunction with other motor parameters to calculate Rated Power Factor (05.010). To perform a Rotating autotune, set Pr 00.040 to 2, and provide the drive with both an enable signal (terminal 2 & 6) and a run signal (terminal 11 or 13).

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the Safe Torque Off signal from terminal 2 & 6, setting the *Drive Enable* (06.015) to OFF (0) or disabling the drive via the *Control Word* (06.042) and *Control Word Enable* (06.043).

UL listing Safety Product Mechanical Electrical Getting Basic Running SD Card Onboard Advanced Optimization Diagnostics informatio installation parameter the moto Operation PLC parameters

Pr 00.007 {05.014} Open Loop Control Mode

There are several voltage modes available which fall into two categories, vector control and fixed boost.

Vector control

Vector control mode provides the motor with a linear voltage characteristic from 0 Hz to motor *Rated Frequency* (00.047), and then a constant voltage above motor rated frequency. When the drive operates between motor rated frequency/50 and motor rated frequency/4, full vector based stator resistance compensation is applied. When the drive operates between motor rated frequency/4 and motor rated frequency/2 the stator resistance compensation is gradually reduced to zero as the frequency increases. For the vector modes to operate correctly the *Rated Power Factor* (00.043), *Stator Resistance* (05.017) are all required to be set up accurately. The drive can be made to measure these by performing an autotune (see Pr 00.040 *Autotune*). The drive can also be made to measure the stator resistance automatically every time the drive is enabled or the first time the drive is enabled after it is powered up, by selecting one of the vector control voltage modes.

- (0) **Ur S** = The stator resistance is measured and the parameter for the selected motor map is over-written each time the drive is made to run. This test can only be done with a stationary motor where the flux has decayed to zero. Therefore this mode should only be used if the motor is guaranteed to be stationary each time the drive is made to run. To prevent the test from being done before the flux has decayed there is a period of 1 second after the drive has been in the ready state during which the test is not done if the drive is made to run again. In this case, previously measured values are used. Ur S mode ensures that the drive compensates for any change in motor parameters due to changes in temperature. The new value of stator resistance is not automatically saved to the drive's EEPROM.
- (1) **Ur** = The stator resistance is not measured. The user can enter the motor and cabling resistance into the *Stator Resistance* (05.017). However this will not include resistance effects within the drive inverter. Therefore if this mode is to be used, it is best to use an autotune test initially to measure the stator resistance.
- (3) **Ur_Auto** = The stator resistance is measured once, the first time the drive is made to run. After the test has been completed successfully the *Open Loop Control Mode* (00.007) is changed to Ur mode. The *Stator Resistance* (05.017) parameter is written to, and along with the *Open Loop Control Mode* (00.007), are saved in the drive's EEPROM. If the test fails, the voltage mode changes to Ur mode but *Stator Resistance* (05.017) is not updated.
- (4) **Ur I** = The stator resistance is measured when the drive is first made to run after each power-up. This test can only be done with a stationary motor. Therefore this mode should only be used if the motor is guaranteed to be stationary the first time the drive is made to run after each power-up. The new value of stator resistance is not automatically saved to the drive's EEPROM.

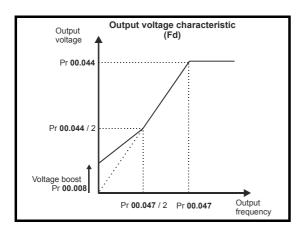

Pr 00.007 {05.014} Open Loop Control Mode (cont)

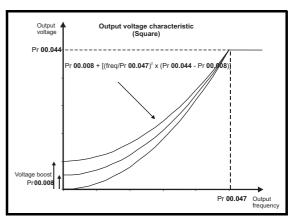

Fixed boost

The stator resistance is not used in the control of the motor, instead a fixed characteristic with low frequency voltage boost as defined by parameter Pr **00.008**, is used. Fixed boost mode should be used when the drive is controlling multiple motors. There are two settings of fixed boost available:

- (2) **Fixed** = This mode provides the motor with a linear voltage characteristic from 0 Hz to *Rated Frequency* (00.047), and then a constant voltage above rated frequency.
- (5) **Square** = This mode provides the motor with a square law voltage characteristic from 0 Hz to *Rated Frequency* (00.047), and then a constant voltage above rated frequency. This mode is suitable for variable torque applications like fans and pumps where the load is proportional to the square of the speed of the motor shaft. This mode should not be used if a high starting torque is required.

For both these modes, at low frequencies (from 0Hz to ½ x Pr 00.047) a voltage boost is applied defined by Pr 00.008 as shown below:

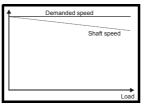

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	0	SD Card	Onboard	Advanced	Diamantina	UL listing
information	information	installation	installation	started	parameters	the motor	Optimization	Operation	PLC	parameters	Diagnostics	information

Pr 05.027 Enable Slip Compensation

When a motor, being controlled in open loop mode, has load applied a characteristic of the motor is that the output speed droops in proportion to the load applied as shown:

In order to prevent the speed droop shown above slip compensation should be enabled. To enable slip compensation Pr **05.027** must be set to a 1 (this is the default setting), and the motor rated speed must be entered in Pr **00.045** (Pr **05.008**).

The motor rated speed parameter should be set to the synchronous speed of the motor minus the slip speed. This is normally displayed on the motor nameplate, i.e. for a typical 18.5 kW, 50 Hz, 4 pole motor, the motor rated speed would be approximately 1465 rpm. The synchronous speed for a 50 Hz, 4 pole motor is 1500 rpm, so therefore the slip speed would be 35 rpm. If the synchronous speed is entered in Pr 00.045, slip compensation will be disabled. If too small a value is entered in Pr 00.045, the motor will run faster than the demanded frequency. The synchronous speeds for 50 Hz motors with different numbers of poles are as follows:

2 pole = 3000 rpm, 4 pole = 1500 rpm, 6 pole =1000 rpm, 8 pole = 750 rpm

8.1.4 RFC-A mode

Induction motor with Position feedback

Pr 00.046 {05.007} Motor Rated Current

Defines the maximum motor continuous current

The motor rated current parameter must be set to the maximum continuous current of the motor. The motor rated current is used in the following:

- Current limits (see section 8.2 Current limits on page 92, for more information).
- · Motor thermal overload protection (see section 8.3 Motor thermal protection on page 92, for more information)
- Vector control algorithm

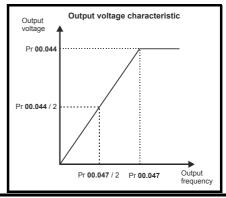

Pr 00.044 {05.009} Rated Voltage

Pr 00.047 {05.006} Rated Frequency

The Rated Voltage (00.044) and the Rated Frequency (00.047) are used to define the voltage to frequency characteristic applied to the motor (see Open Loop Control Mode (00.007), detailed in section 8.1.3). The motor rated frequency is also used in conjunction with the motor rated speed to calculate the rated slip for slip compensation (see motor Rated Speed (00.045), later in this table).

Defines the voltage applied to the motor at rated frequency

Defines the frequency at which rated voltage is applied

Pr 00.045 {05.008} Rated Speed

Pr 00.042 {05.011} Number Of Motor Poles

Defines the full load rated speed of the motor

Defines the number of motor poles

The motor rated speed and motor rated frequency are used to determine the full load slip of the motor which is used by the vector control algorithm. Incorrect setting of this parameter has the following effects:

- · Reduced efficiency of motor operation
- Reduction of maximum torque available from the motor
- Reduced transient performance
- · Inaccurate control of absolute torque in torque control modes

The nameplate value is normally the value for a hot motor; however, some adjustment may be required when the drive is commissioned if the nameplate value is inaccurate. Either a fixed value can be entered in this parameter or an optimization system may be used to automatically adjust this parameter (see *Rated Speed Optimisation Select* (00.033), later in this table).

When Pr **00.042** is set to 'Automatic', the number of motor poles is automatically calculated from the motor *Rated Frequency* (00.047), and the motor *Rated Speed* (00.045).

Number of poles = 120 x (Motor Rated Frequency (00.047 / Motor Rated Speed (00.045) rounded to the nearest even number.

Pr 00.043 {5.10} Rated Power Factor

Defines the angle between the motor voltage and current

The power factor is the true power factor of the motor, i.e. the angle between the motor voltage and current. If the *Stator Inductance* (05.025) is set to zero then the power factor is used in conjunction with the motor *Rated Current* (00.046) and other motor parameters to calculate the rated active and magnetising currents of the motor, which are used in the vector control algorithm. If the stator inductance has a non-zero value this parameter is not used by the drive, but is continuously written with a calculated value of power factor. The stator inductance can be measured by the drive by performing a rotating autotune (see *Autotune* (Pr **00.040**), later in this table).

Safety Product Mechanical Electrical Getting Basic Running SD Card Advanced UL listing Onboard Optimization Diagnostics information information installation started parameters the motor **PLC** parameters

Pr 00.040 {05.012} Autotune

There are four autotune tests available in RFC-A mode, a stationary autotune, a rotating autotune, two mechanical load measurement tests. A stationary autotune will give moderate performance whereas a rotating autotune will give improved performance as it measures the actual values of the motor parameters required by the drive. A mechanical load measurement test should be performed separately to a stationary or rotating autotune.

NOTE

It is highly recommended that a rotating autotune is performed (Pr 00.040 set to 2).

- A stationary autotune can be used when the motor is loaded and it is not possible to remove the load from the motor shaft. The stationary autotune measures the Stator Resistance (05.017) and Transient Inductance (05.024) of the motor. These are used to calculate the current loop gains, and at the end of the test the values in Pr 00.038 and Pr 00.039 are updated. A stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr 00.043. To perform a Stationary autotune, set Pr 00.040 to 1, and provide the drive with both an enable signal (terminal 2 & 6) and a run signal (terminal 11 or 13).
- A rotating autotune should only be used if the motor is unloaded. A rotating autotune first performs a stationary autotune, a rotating test is then performed which the motor is accelerated with currently selected ramps up to a frequency of *Rated Frequency* (00.047) x 2/3, and the frequency is maintained at the level for up to 40 s. During the rotating autotune the *Stator Inductance* (05.025), and the motor saturation breakpoints (Pr 05.029, Pr 05.030, Pr 06.062 and Pr 05.063) are modified by the drive. The *Motor Rated Power Factor* (00.043) is also modified by the *Stator Inductance* (05.025). The No-Load motor core losses are measured and written to *No-Load Core Losses* (04.045). To perform a Rotating autotune, set Pr 00.040 to 2, and provide the drive with both an enable signal (terminal 2 & 6) and a run signal (terminal 11 or 13).
- Mechanical load measurement test using signal injection.
 - This test measures the mechanical characteristic of the motor and load by rotating the motor at the speed defined by the present speed reference and injecting a series of speed test signals. This test should only be used provided all the basic control parameters have been set-up correctly and the speed controller parameters should be set to conservative levels, such as the default values, so that the motor is stable when it runs. The test measures the motor and load inertia, which can be used in automatic set-up of the speed controller gains and in producing a torque feed-forward term. If *Mechanical Load Test Level* (05.021) is left at its default value of zero then the peak level of the injection signal will be 1 % of the maximum speed reference subject to a maximum of 500 rpm. If a different test level is required then *Mechanical Load Test Level* (05.021) should be set to a non-zero value to define the speed of the maximum speed reference, again subject to a maximum of 500 rpm. The user defined speed reference which defines the speed of the motor should be set to a level higher than the test level, but not high enough for flux weakening to become active. In some cases however, it is possible to perform the test at zero speed provided the motor is free to move, but it may be necessary to increase the test signal from the default value. The test will give the correct results when there is a static load applied to the motor and in the presence of mechanical damping. This test should be used if possible, however for sensorless mode, or if the speed controller cannot be set up for stable operation an alternative test is provided (*Autotune* (00.040) = 4) where a series of torque levels are applied to accelerate and decelerate the motor to measure the inertia.
 - 1. A rotating test is performed in which the motor is accelerated with the currently selected ramps up to the currently selected speed reference, and this speed is maintained for the duration of the test. The *Motor And Load Inertia* (03.018) is set-up.

To perform this autotune test, set Pr 00.040 to 3 and provide the drive with both an enable signal (terminal 2 & 6) and a run signal (terminal 11 or 13).

• Mechanical load measurement test using applied torque.

Auto-tune test 3 should normally be used for mechanical load measurement, but under some circumstances this test may be used as an alternative. This test will not give such accurate results as test 3 if the motor rated speed is not set to the correct value for the motor. Also this test is likely to give incorrect results if standard ramp mode is active. A series of progressively larger torque levels are applied to the motor (20 %, 40 % ... 100 % of rated torque) to accelerate the motor up to 3/4 x Rated Speed (00.045) to determine the inertia from the acceleration/deceleration time. The test attempts to reach the required speed within 5 s, but if this fails the next torque level is used. When 100 % torque is used the test allows 60 s for the required speed to be reached, but if this is unsuccessful, an Autotune 1 trip is initiated. To reduce the time taken for the test it is possible to define the level of torque to be used for the test by setting Mechanical Load Test Level (05.021) to a non-zero value. When the test level is defined the test is only carried out at the defined test level and 60 s is allowed for the motor to reach the required speed. It should be noted that if the maximum speed allows for flux weakening then it may not be possible to achieve the required torque level to accelerate the motor fast enough. If this is the case, the maximum speed reference should be reduced.

- 1. The motor is accelerated in the required direction up to 3/4 of the maximum speed reference and then decelerated to zero speed.
- 2. The test is repeated with progressively higher torques until the required speed is reached.
- 3. Motor And Load Inertia (03.018) and Inertia Times 1000 (04.033) are set up.

To perform this autotune test, set Pr 00.040 to 4 and provide the drive with both an enable signal (terminal 2 & 6) and a run signal (terminal 11 or 13).

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the Safe Torque Off signal from terminal 2 & 6, setting the *Drive Enable* (06.015) to Off (0) or disabling the drive via the control word (Pr **06.042** & Pr **06.043**).

Pr 00.033 {05.016} Rated Speed Optimisation Select

The Rated Frequency (00.047) and Rated Speed (00.045) are used to define the rated slip of the motor. The rated slip is used in sensorless mode (Sensorless Mode Active (03.078) = 1) to correct the motor speed with load. When this mode is active Rated Speed Optimisation Select (00.033) has no effect.

If sensorless mode is not active (*Sensorless Mode Active* (03.078) = 0) the rated slip is used in the motor control algorithm and an incorrect value of slip can have a significant effect on the motor performance. If *Rated Speed Optimisation Select* (00.033) = 0 then the adaptive control system is disabled. However, if *Rated Speed Optimisation Select* (00.045) is set to a non-zero value the drive can automatically adjust the *Rated Speed* (00.045) to give the correct value of rated slip. *Rated Speed* (00.045) is not saved at power-down, and so when the drive is powered-down and up again it will return to the last value saved by the user. The rate of convergence and the accuracy of the adaptive controller reduces at low output frequency and low load. The minimum frequency is defined as a percentage of *Rated Frequency* (00.047) by *Rated Speed Optimisation Minimum Frequency* (05.019). The minimum load is defined as a percentage of rated load by *Rated Speed Optimisation Minimum Load* (05.020). The adaptive controller is enabled when a motoring or regenerative load rises above *Rated Speed Optimisation Minimum Load* (05.020) + 5%, and is disabled again when it falls below *Rated Speed Optimisation Minimum Load* (05.020). For best optimisation results the correct values of *Stator Resistance* (05.017), *Transient Inductance* (05.024), *Stator Inductance* (05.025), *Saturation Breakpoint 1* (05.029), *Saturation Breakpoint 3* (05.030) and *Saturation Breakpoint 4* (05.063) should be used.

Pr 00.038 {04.013} / Pr 00.039 {04.014} Current Loop Gains

The current loop gains proportional (Kp) and integral (Ki) gains control the response of the current loop to a change in current (torque) demand. The default values give satisfactory operation with most motors. However, for optimal performance in dynamic applications it may be necessary to change the gains to improve the performance. The *Current Controller Kp Gain* (00.038) is the most critical value in controlling the performance. The values for the current loop gains can be calculated by performing a stationary or rotating autotune (see *Autotune Pr* 00.040, earlier in this table) the drive measures the *Stator Resistance* (05.017) and *Transient Inductance* (05.024) of the motor and calculates the current loop gains.

This will give a step response with minimum overshoot after a step change of current reference. The proportional gain can be increased by a factor of 1.5 giving a similar increase in bandwidth; however, this gives a step response with approximately 12.5 % overshoot. The equation for the integral gain gives a conservative value. In some applications where it is necessary for the reference frame used by the drive to dynamically follow the flux very closely (i.e. high speed Sensorless RFC-A induction motor applications) the integral gain may need to have a significantly higher value.

Safety Product Mechanical Electrical Getting Basic Running SD Card Onboard Advanced **UL** listing Optimization Diagnostics information information parameters

Speed Loop Gains (Pr 00.007 {03.010}, Pr 00.008 {03.011}, Pr 00.009 {03.012})

The speed loop gains control the response of the speed controller to a change in speed demand. The speed controller includes proportional (Kp) and integral (Ki) feed forward terms, and a differential (Kd) feedback term. The drive holds two sets of these gains and either set may be selected for use by the speed controller with Pr 03.016. If Pr 03.016 = 0, gains Kp1, Ki1 and Kd1 (Pr 00.007 to Pr 00.009) are used, and if Pr 03.016 = 1, gains Kp2, Ki2 and Kd2 (Pr 03.013 to Pr 03.015) are used. Pr 03.016 may be changed when the drive is enabled or disabled. If the load is predominantly a constant inertia and constant torque, the drive can calculate the required Kp and Ki gains to give a required compliance angle or bandwidth dependant on the setting of Pr 03.017.

Speed Controller Proportional Gain (Kp), Pr 00.007 {03.010} and Pr 03.013

If the proportional gain has a value and the integral gain is set to zero the controller will only have a proportional term, and there must be a speed error to produce a torque reference. Therefore as the motor load increases there will be a difference between the reference and actual speeds. This effect, called regulation, depends on the level of the proportional gain, the higher the gain the smaller the speed error for a given load. If the proportional gain is too high either the acoustic noise produced by speed feedback quantization becomes unacceptable, or the stability limit is reached.

Speed Controller Integral Gain (Ki), Pr 00.008 (03.011) and Pr 03.014

The integral gain is provided to prevent speed regulation. The error is accumulated over a period of time and used to produce the necessary torque demand without any speed error. Increasing the integral gain reduces the time taken for the speed to reach the correct level and increases the stiffness of the system, i.e. it reduces the positional displacement produced by applying a load torque to the motor. Unfortunately increasing the integral gain also reduces the system damping giving overshoot after a transient. For a given integral gain the damping can be improved by increasing the proportional gain. A compromise must be reached where the system response, stiffness and damping are all adequate for the application. For RFC-A Sensorless mode, it is unlikely that the integral gain can be increased much above 0.50.

Differential Gain (Kd), Pr 00.009 (0 3.012) and Pr 03.015

The differential gain is provided in the feedback of the speed controller to give additional damping. The differential term is implemented in a way that does not introduce excessive noise normally associated with this type of function. Increasing the differential term reduces the overshoot produced by under-damping, however, for most applications the proportional and integral gains alone are sufficient.

There are six methods of tuning the speed loop gains dependant on the setting of Pr 03.017:

1. Pr 03.017 = 0, User set-up.

This involves the connecting of an oscilloscope to analog output 1 to monitor the speed feedback.

Give the drive a step change in speed reference and monitor the response of the drive on the oscilloscope.

The proportional gain (Kp) should be set up initially. The value should be increased up to the point where the speed overshoots and then reduced slightly.

The integral gain (Ki) should then be increased up to the point where the speed becomes unstable and then reduced slightly.

It may now be possible to increase the proportional gain to a higher value and the process should be repeated until the system response matches the ideal response as shown.

The diagram shows the effect of incorrect P and I gain settings as well as the ideal response.

2. Pr **03.017** = 1, Bandwidth set-up

If bandwidth based set-up is required, the drive can calculate Kp and Ki if the following parameters are set up correctly:

Pr 03.020 - Required bandwidth,

Pr 03.021 - Required damping factor,

Pr 03.018 - Motor and load inertia.

The drive can be made to measure the motor and load inertia by performing a mechanical load measurement autotune (see *Autotune* Pr **00.040**, earlier in this table).

3. Pr 03.017 = 2, Compliance angle set-up

If compliance angle based set-up is required, the drive can calculate Kp and Ki if the following parameters are set up correctly:

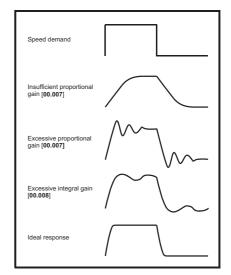

Pr 03.019 - Required compliance angle,

Pr 03.021 - Required damping factor,

Pr **03.018** - Motor and load inertia The drive can be made to measure the motor and load inertia by performing a mechanical load measurement autotune (see *Autotune* Pr **00.040**, earlier in this table).

4. Pr 03.017 = 3, Kp gains times 16

If Speed Controller Set-up Method (03.017) = 3 the selected proportional gain used by the drive is multiplied by 16.

Pr **03.017** = 4 - 6

If Speed Controller Set-up Method (03.017) is set to a value from 4 to 6 the Speed Controller Proportional Gain Kp1 (03.010) and Speed Controller Integral Gain Ki1 (03.011) are automatically set up to give the bandwidths given in the table below and a damping factor of unity. These settings give low, standard or high performance.

Speed Controller Set-up Method (03.017)	Performance	Bandwidth
4	Low	5 Hz
5	Standard	25 Hz
6	High	100 Hz

6. Pr **03.017** = 7

If Speed Controller Set-up Method (03.017) = 7 then Speed Controller Proportional Gain Kp1 (03.010), Speed Controller Integral Gain Ki1 (03.011) and Speed Controller Differential Feedback Gain Kd1 (03.012) are set up to give a closed-loop speed controller response that approximates to a first order system with a transfer function of 1 / (s τ + 1), where τ = 1/ ω bw and ω bw = 2 π x Bandwidth (03.020). In this case the damping factor is meaningless, and Damping Factor (03.021) and Compliance Angle (03.019) have no effect.

8.1.5 RFC-A Sensorless mode

Induction motor without position feedback

Pr 00.046 {05.007} Motor Rated Current

Defines the maximum motor continuous current

The motor rated current parameter must be set to the maximum continuous current of the motor. The motor rated current is used in the following:

- Current limits (see section 8.2 Current limits on page 92, for more information).
- Motor thermal overload protection (see section 8.3 Motor thermal protection on page 92, for more information)
- Vector control algorithm

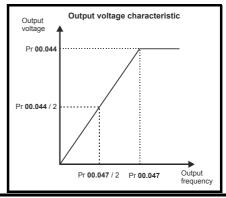

Pr 00.044 {05.009} Rated Voltage

Pr 00.047 {05.006} Rated Frequency

The Rated Voltage (00.044) and the Rated Frequency (00.047) are used to define the voltage to frequency characteristic applied to the motor (see Open Loop Control Mode (00.007), detailed in section 8.1.3). The motor rated frequency is also used in conjunction with the motor rated speed to calculate the rated slip for slip compensation (see motor Rated Speed (00.045), later in this table).

Defines the voltage applied to the motor at rated frequency

Defines the frequency at which rated voltage is applied

Pr 00.045 {05.008} Rated Speed

Pr 00.042 {05.011} Number Of Motor Poles

Defines the full load rated speed of the motor

Defines the number of motor poles

The motor rated speed and motor rated frequency are used to determine the full load slip of the motor which is used by the vector control algorithm. Incorrect setting of this parameter has the following effects:

- Reduced efficiency of motor operation
- Reduction of maximum torque available from the motor
- Reduced transient performance
- · Inaccurate control of absolute torque in torque control modes

The nameplate value is normally the value for a hot motor; however, some adjustment may be required when the drive is commissioned if the nameplate value is inaccurate. Either a fixed value can be entered in this parameter or an optimization system may be used to automatically adjust this parameter (see *Rated Speed Optimization Select* (05.016), later in this table).

When Pr **00.042** is set to 'Automatic', the number of motor poles is automatically calculated from the motor *Rated Frequency* (00.047), and the motor *Rated Speed* (00.045).

Number of poles = 120 x (Motor Rated Frequency (00.047) / Motor Rated Speed (00.045)) rounded to the nearest even number.

Pr 00.043 {5.010} Rated Power Factor

Defines the angle between the motor voltage and current

The power factor is the true power factor of the motor, i.e. the angle between the motor voltage and current. If the *Stator Inductance* (05.025) is set to zero then the power factor is used in conjunction with the motor *Rated Current* (00.046) and other motor parameters to calculate the rated active and magnetising currents of the motor, which are used in the vector control algorithm. If the stator inductance has a non-zero value this parameter is not used by the drive, but is continuously written with a calculated value of power factor. The stator inductance can be measured by the drive by performing a rotating autotune (see *Autotune* (Pr 00.040), later in this table).

Safety Product Mechanical Electrical Getting Basic Running SD Card Onboard Advanced **UL** listing Optimization Diagnostics information information installation installation started parameters the motor Operation **PLC** parameters

Pr 00.040 {05.012} Autotune

There are three autotune tests available in RFC-A mode, a stationary test, a rotating test and a mechanical load measurement test. A stationary autotune will give moderate performance whereas a rotating autotune will give improved performance as it measures the actual values of the motor parameters required by the drive. A mechanical load measurement test should be performed separately to a stationary or rotating autotune.

It is highly recommended that a rotating autotune is performed (Pr 00.040 set to 2).

- A stationary autotune can be used when the motor is loaded and it is not possible to remove the load from the motor shaft. The stationary autotune measures the Stator Resistance (05.017) and Transient Inductance (05.024) of the motor. These are used to calculate the current loop gains, and at the end of the test the values in Pr 00.038 and Pr 00.039 are updated. Maximum Deadtime Compensation (05.059) and Current At Maximum Deadtime Compensation (05.060) for the drive are also measured. Additionally, if Enable Stator Compensation (05.049) = 1, then Stator Base Temperature (05.048) is made equal to Stator Temperature (05.046). A stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr 00.043. To perform a stationary autotune, set Pr 00.040 to 1, and provide the drive with both an enable signal (terminal 2 & 6) and a run signal (terminal 11 or 13).
- A rotating autotune should only be used if the motor is unloaded. A rotating autotune first performs a stationary autotune, a rotating test is then performed in which the motor is accelerated with currently selected ramps up to a frequency of *Rated Frequency* (00.047) x 2/3, and the frequency is maintained at the level for up to 40 s. During the rotating autotune the *Stator Inductance* (05.025), and the motor saturation breakpoints (Pr 05.029, Pr 05.030, Pr 06.062 and Pr 05.063) are modified by the drive. The power factor is also modified for user information only, but is not used after this point as the stator inductance is used in the vector control algorithm instead. To perform a Rotating autotune, set Pr 00.040 to 2, and provide the drive with both an enable signal (terminal 2 & 6) and a run signal (terminal 11 or 13).
- The mechanical load measurement test can measure the total inertia of the load and the motor. This is used to set the speed loop gains (see Speed loop gains) and to provide torque feed-forwards when required during acceleration.

 Applied torque (sensorless mode) This test may give inaccurate results, if the motor rated speed is not set to the correct value for the motor, or if standard ramp mode is active. During the mechanical load measurement test a series of progressively larger torque levels are applied to the motor (20 %, 40 % ... 100 % of rated torque) to accelerate the motor up to $^{3}I_{4}$ x Rated Speed (00.045) to determine the inertia from the acceleration/deceleration time. The test attempts to reach the required speed within 5 s, but if this fails the next torque level is used. When 100 % torque is used the test allows 60 s for the required speed to be reached, but if this is unsuccessful an Autotune 1 trip is initiated. To reduce the time taken for the test it is possible to define the level of torque to be used for the test by setting Mechanical Load Test Level (05.021) to a non-zero value. When the test level is defined the test is only carried out at the defined test level and 60 s is allowed for the motor to reach the required speed. It should be noted that if the maximum speed allows for flux weakening then it may not be possible to achieve the required torque level to accelerate the motor quickly enough. If this is the case, the maximum speed reference should be reduced. To perform a mechanical load measurement autotune, set Pr 00.040 to 4, and provide the drive with both an enable signal (terminal 2 & 6) and a run signal (terminal 11 or 13).

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the Safe Torque Off signal from terminal 2 & 6, setting the *Drive Enable* (06.015) to OFF (0) or disabling the drive via the control word (Pr **06.042** & Pr **06.043**).

Pr 00.038 {04.013} / Pr 00.039 {04.014} Current Loop Gains

The current loop gains proportional (Kp) and integral (Ki) gains control the response of the current loop to a change in current (torque) demand. The default values give satisfactory operation with most motors. However, for optimal performance in dynamic applications it may be necessary to change the gains to improve the performance. The *Current Controller Kp Gain* (00.038) is the most critical value in controlling the performance. The values for the current loop gains can be calculated by performing a stationary or rotating autotune (see *Autotune Pr* **00.040**, earlier in this table) the drive measures the *Stator Resistance* (05.017) and *Transient Inductance* (05.024) of the motor and calculates the current loop gains.

This will give a step response with minimum overshoot after a step change of current reference. The proportional gain can be increased by a factor of 1.5 giving a similar increase in bandwidth; however, this gives a step response with approximately 12.5 % overshoot. The equation for the integral gain gives a conservative value. In some applications where it is necessary for the reference frame used by the drive to dynamically follow the flux very closely (i.e. high speed Sensorless RFC-A induction motor applications) the integral gain may need to have a significantly higher value.

Speed Loop Gains (Pr 00.007 {03.010}, Pr 00.008 {03.011}, Pr 00.009 {03.012})

The speed loop gains control the response of the speed controller to a change in speed demand. The speed controller includes proportional (Kp) and integral (Ki) feed forward terms, and a differential (Kd) feedback term. The drive holds two sets of these gains and either set may be selected for use by the speed controller with Pr 03.016. If Pr 03.016 = 0, gains Kp1, Ki1 and Kd1 (Pr 00.007 to Pr 00.009) are used, and if Pr 03.016 = 1, gains Kp2, Ki2 and Kd2 (Pr 03.013 to Pr 03.015) are used. Pr 03.016 may be changed when the drive is enabled or disabled. If the load is predominantly a constant inertia and constant torque, the drive can calculate the required Kp and Ki gains to give a required compliance angle or bandwidth dependant on the setting of Pr 03.017.

Speed Controller Proportional Gain (Kp), Pr 00.007 {03.010} and Pr 03.013

If the proportional gain has a value and the integral gain is set to zero the controller will only have a proportional term, and there must be a speed error to produce a torque reference. Therefore as the motor load increases there will be a difference between the reference and actual speeds. This effect, called regulation, depends on the level of the proportional gain, the higher the gain the smaller the speed error for a given load. If the proportional gain is too high either the acoustic noise produced by speed feedback quantization becomes unacceptable, or the stability limit is reached.

Speed Controller Integral Gain (Ki), Pr 00.008 {03.011} and Pr 03.014

The integral gain is provided to prevent speed regulation. The error is accumulated over a period of time and used to produce the necessary torque demand without any speed error. Increasing the integral gain reduces the time taken for the speed to reach the correct level and increases the stiffness of the system, i.e. it reduces the positional displacement produced by applying a load torque to the motor. Unfortunately increasing the integral gain also reduces the system damping giving overshoot after a transient. For a given integral gain the damping can be improved by increasing the proportional gain. A compromise must be reached where the system response, stiffness and damping are all adequate for the application. For RFC-A Sensorless mode, it is unlikely that the integral gain can be increased much above 0.50.

Differential Gain (Kd), Pr 00.009 (0 3.012) and Pr 03.015

The differential gain is provided in the feedback of the speed controller to give additional damping. The differential term is implemented in a way that does not introduce excessive noise normally associated with this type of function. Increasing the differential term reduces the overshoot produced by under-damping, however, for most applications the proportional and integral gains alone are sufficient.

There are six methods of tuning the speed loop gains dependant on the setting of Pr 03.017:

1. Pr **03.017** = 0, User set-up.

This involves the connecting of an oscilloscope to analog output 1 to monitor the speed feedback.

Give the drive a step change in speed reference and monitor the response of the drive on the oscilloscope.

The proportional gain (Kp) should be set up initially. The value should be increased up to the point where the speed overshoots and then reduced slightly.

The integral gain (Ki) should then be increased up to the point where the speed becomes unstable and then reduced slightly.

It may now be possible to increase the proportional gain to a higher value and the process should be repeated until the system response matches the ideal response as shown.

The diagram shows the effect of incorrect P and I gain settings as well as the ideal response.

2. Pr **03.017** = 1, Bandwidth set-up

If bandwidth based set-up is required, the drive can calculate Kp and Ki if the following parameters are set up correctly:

Pr 03.020 - Required bandwidth,

Pr 03.021 - Required damping factor,

Pr 03.018 - Motor and load inertia.

The drive can be made to measure the motor and load inertia by performing a mechanical load measurement autotune (see Autotune Pr **00.040**, earlier in this table).

3. Pr 03.017 = 2, Compliance angle set-up

If compliance angle based set-up is required, the drive can calculate Kp and Ki if the following parameters are set up correctly:

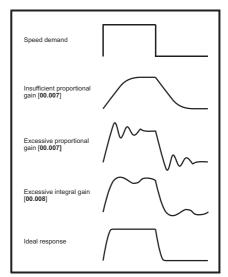

Pr 03.019 - Required compliance angle,

Pr 03.021 - Required damping factor,

Pr **03.018** - Motor and load inertia The drive can be made to measure the motor and load inertia by performing a mechanical load measurement autotune (see *Autotune* Pr **00.040**, earlier in this table).

4. Pr **03.017** = 3, Kp gains times 16

If Speed Controller Set-up Method (03.017) = 3 the selected proportional gain used by the drive is multiplied by 16.

5. Pr **03.017** = 4 - 6

If Speed Controller Set-up Method (03.017) is set to a value from 4 to 6 the Speed Controller Proportional Gain Kp1 (03.010) and Speed Controller Integral Gain Ki1 (03.011) are automatically set up to give the bandwidths given in the table below and a damping factor of unity. These settings give low, standard or high performance.

Pr 03.017	Performance	Bandwidth
4	Low	5 Hz
5	Standard	25 Hz
6	High	100 Hz

6 Pr **03.017** = 7

If Speed Controller Set-up Method (03.017) = 7 then Speed Controller Proportional Gain Kp1 (03.010), Speed Controller Integral Gain Ki1 (03.011) and Speed Controller Differential Feedback Gain Kd1 (03.012) are set up to give a closed-loop speed controller response that approximates to a first order system with a transfer function of 1 / (s τ + 1), where τ = 1/ ω bw and ω bw = 2 π x Bandwidth (03.020). In this case the damping factor is meaningless, and Damping Factor (03.021) and Compliance Angle (03.019) have no effect.

8.2 **Current limits**

The default setting for the current limit parameters is:

- 165 % x motor rated torque producing current for open loop mode
- 250 % x motor rated torque producing current for RFC-A and RFC-S modes

There are three parameters which control the current limits:

- Motoring current limit: power flowing from the drive to the motor
- Regen current limit: power flowing from the motor to the drive
- Symmetrical current limit: current limit for both motoring and regen operation.

The lowest of either the motoring and regen current limit, or the symmetrical current limit applies.

The maximum setting of these parameters depends on the values of motor rated current, drive rated current and the power factor.

The drive can be oversized to permit a higher current limit setting to provide higher accelerating torque as required up to a maximum of 1000 %.

8.3 Motor thermal protection

A dual time constant thermal model is provided to estimate the motor temperature as a percentage of its maximum allowed temperature.

The motor thermal protection is modelled using losses in the motor. The losses in the motor are calculated as a percentage value, so that under these conditions the Motor Protection Accumulator (04.019) would eventually reach 100 %.

Percentage losses = 100 % x [Load related losses + Iron losses] Where:

Load related losses = $(1 - K_{fe}) \times [(I / (K_1 \times I_{Rated}))]^2$

Iron losses = $K_{fe} \times (w / w_{Rated})^{1.6}$

Where:

I = Current Magnitude (00.012)

I_{Rated} = Rated Current (00.046)

 K_{fe} = Rated Iron Losses As Percentage Of Losses (04.039) / 100 %

The Motor Protection Accumulator (04.019) is given by:

Pr **04.019** = Percentage Losses x [(1 - K_2) (1 - $e^{-t/\tau 1}$) + K_2 (1 - $e^{-t/\tau 2}$)]

Where:

T = Motor Protection Accumulator (04.019)

K₂ = Motor Thermal Time Constant 2 Scaling (04.038) / 100 %

 τ^{1} = Motor Thermal Time Constant 1 (00.053)

 τ^2 = Motor Thermal Time Constant 2 (04.037)

 K_1 = Varies, see below

If Rated Current (00.046) ≤ Maximum Heavy Duty Current (00.032)

Motor thermal protection (Heavy Duty) Figure 8-1

If Pr 04.025 is 0 the characteristic is for a motor which can operate at rated current over the whole speed range. Induction motors with this type of characteristic normally have forced cooling. If Pr 04.025 is 1 the characteristic is intended for motors where the cooling effect of motor fan reduces with reduced motor speed below 50 % of base speed/ frequency. The maximum value for K1 is 1.05, so that above the knee of the characteristics the motor can operate continuously up to 105 %

When the estimated temperature in Pr 04.019 reaches 100 % the drive takes some action depending on the setting of Pr 04.016. If Pr 04.016 is 0, the drive trips when Pr **04.019** reaches 100 %. If Pr **04.016** is 1, the current limit is reduced to (K - 0.05) x 100 % when Pr 04.019 reaches 100 %

The current limit is set back to the user defined level when Pr 04.019 falls below 95 %. The thermal model temperature accumulator accumulates the temperature of the motor while the drive remains powered-up. By default, the accumulator is set to the power down value at power-up. If the rated current defined by Pr 00.046 is altered, the accumulator is reset to zero.

The default setting of the thermal time constant (Pr 00.053) is 89 s which is equivalent to an overload of 150 % for 100 s from cold.

SD Card Safety Product Mechanical Electrical Getting Basic Running Onboard Advanced **UL** listing Optimization Diagnostics informatio installation parameter PLC information

8.4 Switching frequency

The default switching frequency is 8 kHz, however this can be increased up to a maximum of 16 kHz by Pr **00.041** (dependent on drive size). The available switching frequencies are shown below.

Table 8-1 Available switching frequencies

Drive size	Model	2 kHz	3 kHz	4 kHz	6 kHz	8 kHz	12 kHz	16 kHz
1								
2	All	✓	✓	✓	✓	✓	✓	✓
3								

If switching frequency is increased from 8 kHz the following apply:

- Increased heat loss in the drive, which means that derating to the output current must be applied.
 See the derating tables for switching frequency and ambient temperature in the Digitax HD M75X Series Installation and Technical Guide.
- Reduced heating of the motor due to improved output waveform quality.
- 3. Reduced acoustic noise generated by the motor.
- Increased sample rate on the speed and current controllers. A trade
 off must be made between motor heating, drive heating and the
 demands of the application with respect to the sample time required.

Table 8-2 Sample rates for various control tasks at each switching frequency

Level	3, 6, 12 kHz	2, 4, 8, 16 kHz	Open loop	RFC-A RFC-S
Level 1	3 kHz - 167μs 6 kHz - 83 μs 12 kHz - 83 μs	2 kHz - 250 μs 4 kHz - 125 μs 8 kHz - 62.5 μs 16 kHz - 62.5 μs	Peak limit	Current controllers
Level 2	250 μs	2 kHz - 500 μs 4 kHz - 250 μs 8 kHz - 250 μs 16 kHz - 250 μs	Current limit and ramps	Speed controller and ramps

Level 4	4	ms		tical user rface
Background				critical user rface

8.5 High speed operation

8.5.1 Encoder feedback limits

The maximum encoder frequency should be prevented from exceeding 500 kHz. In RFC-A and RFC-S modes the maximum speed that can be entered in to the speed reference clamps (Pr **00.002** and Pr **00.001**) can be limited by the drive. This is defined by the following (subject to an absolute maximum of 33,000 rpm):

Maximum speed limit (rpm) =
$$\frac{500 \text{ kHz x } 60}{\text{ELPR}}$$
$$= \frac{3.0 \times 10^{7}}{\text{ELPR}}$$

Where:

ELPR is the equivalent encoder lines per revolution and is the number of lines that would be produced by a quadrature encoder.

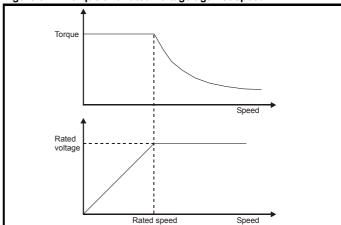

- Quadrature encoder ELPR = number of lines per revolution
- F and D encoder ELPR = number of lines per revolution / 2
- SINCOS encoder ELPR = number of sine waves per revolution

This maximum speed limit is defined by the device selected with the speed feedback selector (Pr 03.026), and the ELPR set for the position feedback device. In RFC-A mode it is possible to disable this limit via Pr 03.024, so that the drive can be switched between operation with and without feedback when the speed becomes too high for the feedback device.

8.5.2 Field weakening (constant power) operation (Open loop and RFC-A mode only)

The drive can be used to run an induction machine above synchronous speed into the constant power region. The speed continues to increase and the available shaft torque reduces. The characteristics below show the torque and output voltage characteristics as the speed is increased above the rated value.

Figure 8-2 Torque and rated voltage against speed

Care must be taken to ensure the torque available above base speed is sufficient for the application to run satisfactorily. The saturation breakpoint parameters (Pr 05.029, Pr 05.030, Pr 05.062 and Pr 05.063) found during the autotune in RFC-A mode ensure the magnetizing current is reduced in the correct proportion for the specific motor. (In open loop mode the magnetizing current is not actively controlled).

Safety Product Mechanical Electrical Getting Basic Running SD Card Onboard Advanced **UL** listing Optimization Diagnostics informatior information installation installation the moto Operation **PLC** parameters

8.5.3 Permanent magnet motor high speed operation

High speed servo mode is enabled by setting Pr **05.022** =1. Care must be taken when using this mode with permanent magnet motor to avoid damaging the drive. The voltage produced by the permanent magnet motor magnets is proportional to speed. For high speed operation the drive must apply currents to the motor to counter-act the flux produced by the magnets. It is possible to operate the motor at very high speeds that would give a very high motor terminal voltage, but this voltage is prevented by the action of the drive.

If however, the drive is disabled (or tripped) when the motor voltages would be higher than the rating of the drive without the currents to counter-act the flux from the magnets, it is possible to damage the drive. If high speed mode is enabled the motor speed must be limited to the levels given in the table below unless an additional hardware protection system is used to limit the voltages applied to the drive output terminals to a safe level.

Drive voltage rating	Maximum motor speed (rpm)	Maximum safe line to line voltage at the motor terminals (V rms)
200	400 x 1000 / (Ke x √2)	400 / √2
400	800 x 1000 / (Ke x √2)	800 / √2
575	955 x 1000 / (Ke x √2)	955 / √2
690	1145 x 1000 / (Ke x √2)	1145 / √2

Ke is the ratio between r.m.s. line to line voltage produced by the motor and the speed in V/1000 rpm. Care must also be taken not to demagnetize the motor. The motor manufacturer should always be consulted before using this mode.

By default, high speed operation is disabled (Pr **05.022** = 0).

It is also possible to enable high speed operation and allow the drive to automatically limit the motor speed to the levels specified in the table and generate an *Overspeed.1* trip if the level is exceeded (Pr **05.022** = -1).

8.5.4 Switching frequency

Ideally a minimum ratio of 12:1 should be maintained between the switching frequency and the output frequency. This ensures the number of switchings per cycle is sufficient to ensure the output waveform quality is maintained at a minimum level. If this is not possible, quasi-square switching should be enabled (Pr 05.020 =1). The output waveform will be quasi square above base speed ensuring a symmetrical output waveform, which results in a better quality output than would otherwise result.

8.5.5 Maximum speed / frequency

In all operating modes (Open loop, RFC-A and RFC-S) the maximum output frequency is limited to 550 Hz. However, in RFC-S mode the speed is also limited by the voltage constant (Ke) of the motor. Ke is a specific constant for the servo motor being used. It can normally be found on the motor data sheet in V/k rpm (volts per 1,000 rpm).

8.5.6 Quasi-Square wave (open-loop only)

The maximum output voltage level of the drive is normally limited to an equivalent of the drive input voltage minus voltage drops within the drive (the drive will also retain a few percent of the voltage in order to maintain current control). If the motor rated voltage is set at the same level as the supply voltage, some pulse deletion will occur as the drive output voltage approaches the rated voltage level. If Pr **05.020** (Quasi-square wave enable) is set to 1 the modulator will allow over modulation, so that as the output frequency increases beyond the rated frequency the voltage continues to increase above the rated voltage. The modulation depth will increase beyond unity; first producing trapezoidal and then quasi-square waveforms.

This can be used for example:

 To obtain high output frequencies with a low switching frequency which would not be possible with space vector modulation limited to unity modulation depth, or

 In order to maintain a higher output voltage with a low supply voltage.

The disadvantage is that the machine current will be distorted as the modulation depth increases above unity, and will contain a significant amount of low order odd harmonics of the fundamental output frequency. The additional low order harmonics cause increased losses and heating in the motor.

8.6 Modbus RTU specification (EIA-485)

This section describes the adaptation of the MODBUS RTU protocol. The portable software class which implements this protocol is also defined. MODBUS RTU is a master slave system with half-duplex message exchange. The core function codes to read and write registers are supported. A scheme to map between MODBUS registers and parameters is defined. The implementation also defines a 32 bit extension to the standard 16 bit register data format

8.6.1 MODBUS RTU

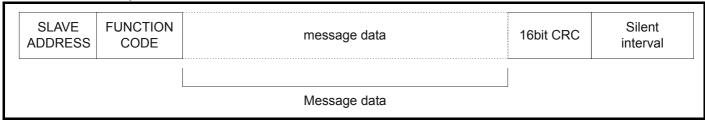

Physical layer

Attribute	Description
Normal physical layer for multi-drop operation	EIA-485 2 wire
Bit stream	Standard UART asynchronous symbols with Non Return to Zero (NRZ)
Symbol	Each symbol consists of:- 1 start bit 8 data bits (transmitted least significant bit first) 2 stop bits*
Baud rates	300, 600, 1200, 2400, 4800, 9600, 19200, 38400, 57600, 76800, 115200

^{*} The drive will accept a packet with 1 or 2 stop bits but will always transmit 2 stop bits

RTU framing

The frame has the following basic format

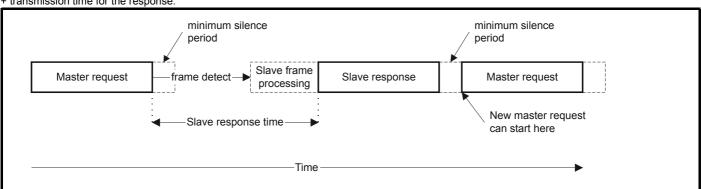

The frame is terminated with a minimum silent period of 3.5 character times (for example, at 19200 baud the minimum silent period is 2 ms). Nodes use the terminating silence period to detect the end of frame and begin frame processing. All frames must therefore be transmitted as a continuous stream without any gaps greater or equal to the silence period. If an erroneous gap is inserted then receiving nodes may start frame processing early in which case the CRC will fail and the frame will be discarded.

MODBUS RTU is a master slave system. All master requests, except broadcast requests, will lead to a response from an individual slave. The slave will respond (i.e. start transmitting the response) within the quoted maximum slave response time (this time is quoted in the data sheet for all products). The minimum slave response time is also quoted but will never be less that the minimum silent period defined by 3.5 character times.

If the master request was a broadcast request then the master may transmit a new request once the maximum slave response time has expired.

The master must implement a message time out to handle transmission errors. This time out period must be set to the maximum slave response time + transmission time for the response.

8.6.2 Slave address

The first byte of the frame is the slave node address. Valid slave node addresses are 1 through 247 decimal. In the master request this byte indicates the target slave node; in the slave response this byte indicates the address of the slave sending the response.

Global addressing

Address zero addresses all slave nodes on the network. Slave nodes suppress the response messages for broadcast requests.

8.6.3 MODBUS registers

The MODBUS register address range is 16 bit (65536 registers) which at the protocol level is represented by indexes 0 through 65535.

PLC registers

Modicon PLCs typically define 4 register 'files' each containing 65536 registers. Traditionally, the registers are referenced 1 through 65536 rather than 0 through 65535. The register address is therefore decremented on the master device before passing to the protocol.

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Ontimization	SD Card	Onboard	Advanced	Diagnostics	UL listing
information	information	installation	installation	started	parameters	the motor	Optimization	Operation	PLC	parameters	Diagnostics	information

File type	Description	Supported
1	Read only bits ("coil")	Use register
2	Read / write bits ("coil")	Use register
3	Read only 16 bit register	Yes
4	Read / write 16 bit register	Yes

The register file type code is NOT transmitted by MODBUS and all register files can be considered to map onto a single register address space.

However, specific function codes are defined in MODBUS to support access to the "coil" registers.

All standard drive parameters are mapped to register file '4' and the coil function codes are not required.

Parameter mapping

The Modbus register address is 16 bits in size, of which the upper two bits are used for data type selection leaving 14 bits to represent the parameter address, taking into account the slave increments the address value by 1, this results in a theoretical maximum parameter address of 163.84 (limited to 162.99 in software) when the default standard addressing mode (see *Serial Mode* (11.024)) is used.

To access a parameter number above 99 in any drive menu then the modified addressing mode must be used (see *Serial Mode* (11.024)), this will allow access to parameter numbers up to 255 but also limit the maximum menu number to 63.

The Modbus slave device increments the register address by 1 before processing the command, this effectively prevents access to parameter Pr **00.000** in the drive or option module.

The table below shows how the start register address is calculated for both addressing modes.

Parameter	Addressing mode		Protocol register				
0 mm nnn	Standard	mm x 100 + ppp - 1					
0.mm.ppp	Modified		mm x 256	+ ppp - 1			
		Examples					
		16-1	oit	32-bit			
		Decimal	Hex (0x)	Decimal	Hex (0x)		
0.01.021	Standard	120	00 78	16504	40 78		
0.01.021	Modified	276	01 14	16660	41 14		
0.01.000	Standard	99	00 63	16483	40 63		
0.01.000	Modified	255	00 FF	16639	40 FF		
0.03.161	Standard	N/A	N/A	N/A	N/A		
0.03.161	Modified	928	03 A0	17312	43 A0		

Data types

The MODBUS protocol specification defines registers as 16 bit signed integers. All devices support this data size.

Refer to the section 8.6.7 Extended data types on page 98 for detail on accessing 32 bit register data.

8.6.4 Data consistency

All devices support a minimum data consistency of one parameter (16 bit or 32 bit data). Some devices support consistency for a complete multiple register transaction.

8.6.5 Data encoding

MODBUS RTU uses a 'big-endian' representation for addresses and data items (except the CRC, which is 'little-endian'). This means that when a numerical quantity larger than a single byte is transmitted, the MOST significant byte is sent first. So for example

16 - bits 0x1234 would be 0x12 0x34

32 - bits 0x12345678 would be 0x12 0x34 0x56 0x78

8.6.6 Function codes

The function code determines the context and format of the message data. Bit 7 of the function code is used in the slave response to indicate an exception.

The following function codes are supported:

Code	Description		
3	Read multiple 16 bit registers		
6	Write single register		
16	Write multiple 16 bit registers		
23	Read and write multiple 16 bit registers		

FC03 Read multiple

Read a contiguous array of registers. The slave imposes an upper limit on the number of registers, which can be read. If this is exceeded the slave will issue an exception code 2.

8.6.7 Extended data types

Standard MODBUS registers are 16bit and the standard mapping maps a single #X.Y parameter to a single MODBUS register. To support 32 bit data types (integer and float) the MODBUS multiple read and write services are used to transfer a contiguous array of 16bit registers.

Slave devices typically contain a mixed set of 16 bit and 32 bit registers. To permit the master to select the desired 16 bit or 32 bit access the top two bits of the register address are used to indicate the selected data type.

NOTE

The selection is applied for the whole block access.

bit 15 TYP1	bit 14 TYP0	bits 0 - 13
Type	select	Parameter address X x 100+Y-1

The 2bit type field selects the data type according to the table below:

Type field bits 15-14	Selected data type	Comments
00	INT16	backward compatible
01	INT32	
10	Float32	Not supported
11	Reserved	

If a 32 bit data type is selected then the slave uses two consecutive 16 bit MODBUS registers (in 'big endian'). The master must also set the correct 'number of 16 bit registers'.

Example, read Pr **20.021** through Pr **20.024** as 32 bit parameters using FC03 from node 8:

Table 8-11 Master request

Byte	Value	Description
0	0x08	Slave destination node address
1	0x03	FC03 multiple read
2	0x47	Start register address Pr 20.021
3	0xE4	(16384 + 2021 - 1) = 18404 = 0x47E4
4	0x00	Number of 16bit registers to read
5	0x08	Pr 20.021 through Pr 20.024 is 4x32 bit registers = 8x16 bit registers
6	CRC LSB	CRC
7	CRC MSB	CRC

19	CRC LSB	CRC
20	CRC MSB	CRC

Reads when actual parameter type is different from selected

The slave will send the least significant word of a 32 bit parameter if that parameter is read as part of a 16 bit access.

The slave will sign extend the least significant word if a 16 bit parameter is accessed as a 32 bit parameter. The number of 16 bit registers must be even during a 32 bit access.

Example, If Pr **01.028** is a 32 bit parameter with a value of 0x12345678, Pr **01.029** is a signed 16 bit parameter with a value of 0xABCD, and Pr **01.030** is a signed 16 bit parameter with a value of 0x0123.

	-			Ī	
Read	Start register address	Number of 16 bit registers	Response	Comments	
Pr 01.028	127	1	0x5678	Standard 16 bit access to a 32 bit register will return low 16 bit word of truncated data	
Pr 01.028	16511*	2	0x12345678	Full 32 bit access	
Pr 01.028	16511*	1	Exception 2	Number of words must be even for 32 bit access	
Pr 01.029	128	1	0xABCD	Standard 16 bit access to a 32 bit register will return low 16 bit word of data	
Pr 01.029	16512*	2	0xFFFFABCD	32 bit access to a 16 bit register will return 32 bit sign extended data	
Pr 01.030	16513*	2	0x00000123	32 bit access to a 16 bit register will return 32 bit sign extended data	
Pr 01.028 to Pr 01.029	127	2	0x5678, 0xABCD	Standard 16 bit access to a 32 bit register will return low 16 bit word of truncated data	
Pr 01.028 to Pr 01.029	16511*	4	0x12345678, 0xFFFFABCD	Full 32 bit access	

^{*} Bit 14 is set to allow 32 bit access.

Writes when actual parameter type is different from selected

The slave will allow writing a 32 bit value to a 16 bit parameter as long as the 32 bit value is within the normal range of the 16 bit parameter.

The slave will allow a 16 bit write to a 32 bit parameter. The slave will sign extend the written value, therefore the effective range of this type of write will be -32768 to +32767.

Examples, if Pr 01.028 has a range of ± 100000 , and Pr 01.029 has a range of ± 10000 .

^{*} Bit 14 is set to allow 32 bit access

8.6.8 Exceptions

The slave will respond with an exception response if an error is detected in the master request. If a message is corrupted and the frame is not received or the CRC fails then the slave will not issue an exception. In this case the master device will time out. If a write multiple (FC16 or FC23) request exceeds the slave maximum buffer size then the slave will discard the message. No exception will be transmitted in this case and the master will time out.

Exception message format

The slave exception message has the following format.

Byte	Description			
0	Slave source node address			
1	Original function code with bit 7 set			
2	Exception code			
3	CRC LSB			
4	CRC MSB			

Exception codes

The following exception codes are supported.

Code	Description
1	Function code not supported
2	Register address out of range, or request to read too many registers

Parameter over range during block write FC16

The slave processes the write block in the order the data is received. If a write fails due to an out of range value then the write block is terminated. However, the slave does not raise an exception response, rather the error condition is signalled to the master by the number of successful writes field in the response.

Parameter over range during block read/write FC23

There will be no indication that there has been a value out of range during a FC23 access.

8.6.9 CRC

The CRC is a 16 bit cyclic redundancy check using the standard CRC-16 polynomial x16 + x15 + x2 + 1. The 16 bit CRC is appended to the message and transmitted LSB first.

The CRC is calculated on ALL the bytes in the frame.

8.6.10 Device compatibility parameters

All devices have the following compatibility parameters defined:

``	• • • • • • • • • • • • • • • • • • • •
Parameter	Description
Device ID	Unique device identification code
Minimum slave response time	The minimum delay between the end of a message from the master and the time at which the master is ready to receive a response from the slave. Refer to par 11-26.
Maximum slave response time	When global addressing, the master must wait for this time before issuing a new message. In a network of devices, the slowest time must be used.
Baud rate	Baud rate used by Modbus RTU.
32 bit float data type supported	If this data type is not supported then an over range error will be raised if this data type is used.
Maximum buffer size	Determines the maximum block size.

Safety Product Information Installation Inst

9 SD Card Operation

9.1 Introduction

The Non-Volatile Media Card feature enables simple configuration of parameters, parameter back-up, storing / reading PLC programs and drive copying using an SD card storing / reading PLC programs.

The SD Card can be used for:

- · Parameter copying between drives
- Saving drive parameter sets
- · Saving an onboard user program

The SC Card slot is located at the middle of the module, adjacent to the drive compact display (if installed) on the right-hand side.

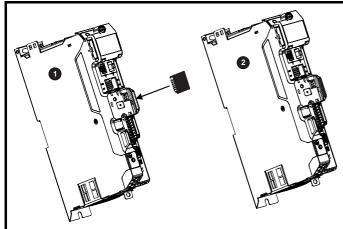

Ensure the SD Card is inserted with the contacts facing the left-hand side of the drive.

The drive only communicates with the SD Card when commanded to read or write, meaning the card may be "hot swapped".

Beware of possible live terminals when installing the SD Card.

Figure 9-1 Installation of the SD Card

- 1. Installing the SD Card
- 2. SD Card installed

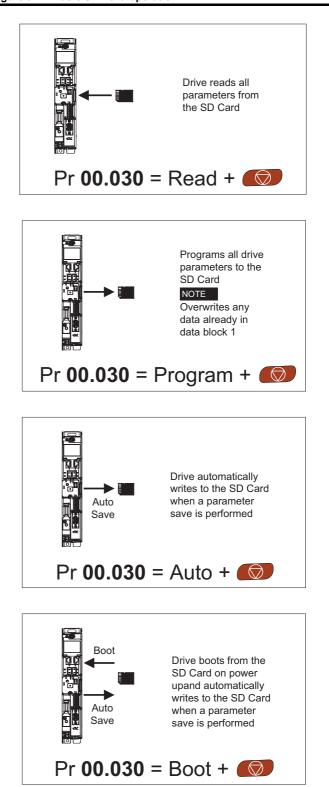

9.2 SD Card support

The SD Card can be used to store drive parameter sets and / or PLC programs set from the Digitax HD in data blocks 001 to 499 on the card.

NOTE

If the read only flag is set then only codes 6yyy or 9777 are effective.

Figure 9-2 Basic SD Card operation

The whole card may be protected from writing or erasing by setting the read-only flag as detailed section 9.3.9 9888 / 9777 - Setting and clearing the SD Card read only flag on page 102.

The card should not be removed during data transfer, as the drive will produce a trip. If this occurs then either the transfer should be reattempted or in the case of a card to drive transfer, default parameters should be loaded.

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Ontimization	SD Card	Onboard	Advanced	Diagnostics	UL listing
information	information	installation	installation	started	parameters	the motor	Optimization	Operation	PLC	parameters	Diagnostics	information

9.3 Transferring data

Data transfer, erasing and protecting the information is performed by entering a code in Pr mm.000 and then resetting the drive as shown in Table 9-

Table 9-1 SD card codes

Code	Operation	SD card
2001	Transfer the drive parameters to parameter file 001 and sets the block as bootable. This will include the parameters from attached option modules.	✓
4ууу	Transfer the drive parameters to parameter file yyy. This will include the parameters from attached option modules.	✓
5ууу	Transfer the onboard user program to onboard user program file yyy.	✓
6ууу	Load the drive parameters from parameter file yyy or the onboard user program from onboard user program file yyy.	✓
7ууу	Erase file yyy.	✓
8ууу	Compare the data in the drive with file yyy. If the files are the same then <i>Pr mm.000</i> (mm.000) is simply reset to 0 when the compare is complete. If the files are different a 'Card Compare' trip is initiated. All other SD card trips also apply.	✓
9555	Clear the warning suppression flag	✓
9666	Set the warning suppression flag	✓
9777	Clear the read-only flag	✓
9888	Set the read-only flag	✓
9999	Erase and format the SD card	

Where yyy indicates the block number 001 to 999.

NOTE

If the read only flag is set then only codes 6yyy or 9777 are effective.

9.3.1 Writing to the SD Card

4yyy - Writes defaults differences to the SD Card

The data block only contains the parameter differences from the last time default settings were loaded.

All parameters except those with the NC (Not copied) coding bit set are transferred to the SD Card. In addition to these parameters all menu 20 parameters (except Pr **20.000**), can be transferred to the SD Card.

Writing a parameter set to the SD Card (Pr 00.030 = Program (2))

Setting Pr **00.030** to Program (2) and resetting the drive will save the parameters to the SD Card, i.e. this is equivalent to writing 4001 to Pr **mm.000**. All SD Card trips apply except 'Card Change'. If the data block already exists it is automatically overwritten. When the action is complete this parameter is automatically reset to None (0).

9.3.2 Reading from the SD Card 6yyy - Reading from SD Card

When the data is transferred back to the drive, using 6yyy in Pr mm.000, it is transferred to the drive RAM and the EEPROM. A parameter save is not required to retain the data after-power down. Set up data for any option modules installed stored on the card are transferred to the drive. If the option modules installed are different between source and destination drives, the menus for the option module slots where the option module categories are different are not updated from the card and will contain their default values after the copying action. The drive will produce a 'Card Option' trip if the option module installed to the source and the destination drives are different or are in different slots. If the data is being transferred to the drive with different voltage or current rating a 'Card Rating' trip will occur.

The following drive rating dependant parameters (RA coding bit set) will not be transferred to the destination drive by a SD Card when the voltage rating of the destination drive is different from the source drive and the file is a parameter file.

However, drive rating dependent parameters will be transferred if only the current rating is different. If drive rating dependant parameters are not transferred to the destination drive they will contain their default values.

Pr 02.008 Standard Ramp Voltage

Pr **04.005** to Pr **04.007** and Pr **21.027** to Pr **21.029** *Motoring Current Limits*

Pr 04.024, User Current Maximum Scaling

Pr 05.007, Pr 21.007 Rated Current

Pr 05.009, Pr 21.009 Rated Voltage

Pr 05.010, Pr 21.010 Rated Power Factor

Pr 05.017, Pr 21.012 Stator Resistance

Pr 05.018 Maximum Switching Frequency

Pr 05.024, Pr 21.014 Transient Inductance

Pr 05.025, Pr 21.024 Stator Inductance

Pr 06.006 Injection Braking Level

Pr 06.048 Supply Loss Detection Level

Pr **06.065** Standard Under Voltage Threshold

Pr **06.066** Low Under Voltage Threshold

Pr 06.073 Braking IGBT Lower Threshold

Pr **06.074** Braking IGBT Upper Threshold

Pr 06.075 Low Voltage Braking IGBT Threshold

Reading a parameter set from the SD Card (Pr 00.030 = Read (1))

Setting Pr **00.030** to Read (1) and resetting the drive will transfer the parameters from the card into the drive parameter set and the drive EEPROM, i.e. this is equivalent to writing 6001 to Pr **mm.000**.

All SD Card trips apply. Once the parameters are successfully copied this parameter is automatically reset to None (0). Parameters are saved to the drive EEPROM after this action is complete.

9.3.3 Auto saving parameter changes (Pr 00.030 = Auto (3))

This setting causes the drive to automatically save any changes made to menu 0 parameters on the drive to the SD Card. The latest menu 0 parameter set in the drive is therefore always backed up on the SD Card. Changing Pr **00.030** to Auto (3) and resetting the drive will immediately save the complete parameter set from the drive to the card, i.e. all parameters except parameters with the NC coding bit set. Once the whole parameter set is stored only the individual modified menu 0 parameter setting is updated.

Advanced parameter changes are only saved to the SD Card when Pr mm.000 is set to 'Save Parameters' or a 1001 and the drive reset.

All SD Card trips apply, except 'Card Change'. If the data block already contains information it is automatically overwritten.

Safety Product Mechanical Electrical Getting Basic Running SD Card Onboard Advanced UL listing Optimization Diagnostics informatior information installation installation started the motor Operation

If the card is removed when Pr **00.030** is set to 3 Pr **00.030** is then automatically set to None (0).

When a new SD Card is installed Pr **00.030** must be set back to Auto (3) by the user and the drive reset so the complete parameter set is rewritten to the new SD Card if auto mode is still required.

When Pr **00.030** is set to Auto (3) and the parameters in the drive are saved, the SD Card is also updated, and therefore the SD Card becomes a copy of the drives stored configuration.

At power up, if Pr **00.030** is set to Auto (3), the drive will save the complete parameter set to the SD Card. The drive will display 'Card Write' during this operation. This is done to ensure that if a user puts a new SD Card in during power down the new SD Card will have the correct data.

NOTE

When Pr 00.030 is set to Auto (3) the setting of Pr 00.030 itself is saved to the drive EEPROM but not the SD Card.

9.3.4 Booting up from the SD Card on every power up (Pr 00.030 = Boot (4))

When Pr **00.030** is set to Boot (4) the drive operates the same as Auto mode except when the drive is powered-up. The parameters on the SD Card will be automatically transferred to the drive at power up if the following are true:

- · A card is inserted in the drive
- · Parameter data block 1 exists on the card
- The data in block 1 is type 1 to 4 (as defined in Pr 11.038)
- Pr 00.030 on the card set to Boot (4)

The drive will display 'Booting Parameters during this operation. If the drive mode is different from that on the card, the drive gives a 'Card Drive Mode' trip and the data is not transferred.

If 'Boot' mode is stored on the copying SD Card this makes the copying SD Card the master device. This provides a very fast and efficient way of re-programming a number of drives.

NOTE

Boot' mode is saved to the card, but when the card is read, the value of Pr **00.030** is not transferred to the drive.

9.3.5 Booting up from the SD Card on every power up (Pr mm.000 = 2001)

It is possible to create a bootable parameter data block by setting Pr mm.000 to 2001 and initiating a drive reset. This data block is created in one operation and is not updated when further parameter changes are made.

Setting Pr mm.000 to 2001 will overwrite the data block 1 on the card if it already exists.

9.3.6 8yyy - Comparing the drive full parameter set with the SD Card values

Setting 8yyy in Pr **mm.000**, will compare the SD Card file with the data in the drive. If the compare is successful Pr **mm.000** is simply set to 0. If the compare fails a 'Card Compare' trip is initiated.

9.3.7 7yyy - Erasing data from the SD Card values Data can be erased from the SD Card one block at a time.

• Setting 7yyy in Pr mm.000 will erase SD Card data block yyy.

9.3.8 9666 / 9555 - Setting and clearing the SD Card warning suppression flag

If the option modules installed to the source and destination drive are different or are in different slots the drive will produce a 'Card Option' trip.

If the data is being transferred to a drive of a different voltage or current rating a 'Card Rating' trip will occur. It is possible to suppress these trips by setting the warning suppression flag. If this flag is set the drive will not trip if the option module(s) or drive ratings are different between the source and destination drives. The options module or rating dependent parameters will not be transferred.

- Setting 9666 in Pr **mm.000** will set the warning suppression flag
- Setting 9555 in Pr mm.000 will clear the warning suppression flag

9.3.9 9888 / 9777 - Setting and clearing the SD Card read only flag

The SD Media Card may be protected from writing or erasing by setting the read only flag. If an attempt is made to write or erase a data block when the read only flag is set, a 'Card Read Only' trip is initiated. When the read only flag is set only codes 6yyy or 9777 are eff.

- · Setting 9888 in Pr mm.000 will set the read only flag
- Setting 9777 in Pr mm.000 will clear the read only flag

9.4 Data block header information

Each data block stored on an SD Card has header information detailing the following:

- NV Media Card File Number (11.037)
- NV Media Card File Type (11.038)
- NV Media Card File Version (11.039)
- NV Media Card File Checksum (11.040)

The header information for each data block which has been used can be viewed in Pr 11.038 to Pr 11.040 by increasing or decreasing the data block number set in Pr 11.037. If there is no data on the card Pr 11.037 can only have a value of 0.

9.5 SD Card parameters

Table 9-2 Key to parameter table coding

RW	Read / Write	ND	No default value
RO	Read only	NC	Not copied
Num	Number parameter	PT	Protected parameter
Bit	Bit parameter	RA	Rating dependant
Txt	Text string	US	User save
Bin	Binary parameter	PS	Power-down save
FI	Filtered	DE	Destination

11.036	{00	.029}	NV Media Card File Previously Loaded									
RO		Num						NC	PT			
OL												
RFC-A	Û		0 to 999						0			
RFC-S												

This parameter shows the number of the data block last transferred from an SD Card to the drive. If defaults are subsequently reloaded this parameter is set to 0

11	.03	7	NV Media Card File Number										
RW Num													
OL													
RFC-A	Û		0 to	999		\Rightarrow			0				
RFC-S	:c-s												

This parameter is used to select a data block file by its file identification number and can only be changed to values that correspond to files that are recognised by the drive on the SD card or a value of 0. When *NV Media Card File Number* (Pr 11.037) corresponds to the number of a data block file, Pr 11.038, Pr 11.039 and Pr 11.040 are populated with data relating to that specific file number.

11	.03	8	NV Media Card File Type								
RO Txt						Ν	D	NC	PT		
OL RFC-A	\$	RFC	(0), Op C-A (2),	RFC-S	3 (3),	⇧					
* Rege			Option								

Displays the type/mode of the data block selected with Pr 11.037.

Pr 11.038	String	Type / mode
0	None	No file selected
1	Open-loop	Open-loop mode parameter file
2	RFC-A	RFC-A mode parameter file
3	RFC-S	RFC-S mode parameter file
4	Regen	Regen mode parameter file
5	User Prog	Onboard user program file
6	Option App	Option module application file

11	11.039			NV Media Card File Version										
RO		Num				ND N		NC	PT					
OL														
RFC-A	Û		0 to 9999											
RFC-S														

Displays the version number of the file selected in Pr 11.037.

11.04	0	NV Media Card File Checksum										
RO	Num				ND)	NC	PT				
OL RFC-A RFC-S	-	214748 21474		0	\Diamond							

Displays the checksum of the data block selected in Pr 11.037.

11.042	{00	.030}	Parameter Cloning									
RW		Txt						NC		US*		
OL RFC-A RFC-S	RW Txt								None	(0)		

^{*} Only a value of 3 or 4 in this parameter is saved.

NOTE

If Pr 11.042 is equal to 1 or 2, this value is not transferred to the drive or saved to the EEPROM. If Pr 11.042 is set to 3 or 4 the value is saved to the EEPROM

None (0) = Inactive

Read (1) = Read parameter set from the SD Card

Program (2) = Program a parameter set to the SD Card

Auto (3) = Auto save

Boot (4) = Boot mode

11	.07	2	NV Media Card Create Special File									
RW		Num						NC				
OL												
RFC-A	${\mathfrak J}$		0 to 1			\Box			0			
RFC-S												

If NV Media Card Create Special File (11.072) = 1 when a parameter file is transferred to an SD card the file is created as a macro file. NV Media Card Create Special File (11.072) is reset to 0 after the file is created or the transfer fails.

11.	073	3	NV M	edia Ca	ard Typ	е				
RO		Txt				Ν	D	NC	PT	
OL RFC-A RFC-S	⇕	Non	e (0), S	SD Car	d (1)	仓				

This will display the type of media card inserted; it will contain one of the following values:

"None" (0) - No SD Card has been inserted.

"SD Card" (1) - A FAT formatted SD card has been inserted.

11	.07	5	NV Media Card Re				ead-only Flag					
RO		Bit				ND	NC	PT				
OL												
RFC-A	${\mathfrak J}$	C	Off (0) or On (1)									
RFC-S			Oir (0) or On (1)									

NV Media Card Read-only Flag (11.075) shows the state of the read-only flag for the currently installed card.

		Media Card Warning Suppression Flag							
RO	Bit			NE	D	NC	PT		
OL RFC-A ①	Off (0) o	or On (1	1)	廿					

NV Media Card Warning Suppression Flag (11.076) shows the state of the warning flag for the currently installed card.

11	.07	7	NV Me	NV Media Card File Required Version							
RW		Num				N	D	NC	PT		
OL											
RFC-A	${\mathfrak J}$		0 to	9999		⇒					
RFC-S											

The value of *NV Media Card File Required Version* (11.077) is used as the version number for a file when it is created on an SD Card. *NV Media Card File Required Version* (11.077) is reset to 0 when the file is created or the transfer fails.

9.6 SD Card trips

After an attempt to read, write or erase data from an SD Card, a trip is initiated if there has been a problem with the command.

See Chapter 12 *Diagnostics* on page 192 for more information on SD Card trips.

Safety Product Mechanical Electrical Getting Basic Running SD Card Advanced UL listing Optimization Diagnostics information installation started parameter the motor PLC

10 Onboard PLC

10.1 Onboard PLC and Machine Control Studio

The drive has the ability to store and execute a 16 kB Onboard PLC user program without the need for additional hardware in the form of an option module.

Machine Control Studio is an IEC61131-3 development environment designed for use with Digitax HD and compatible application modules.

All of the programming languages defined in the IEC standard IEC 61131-3 are supported in the Machine Control Studio development environment.

- · ST (Structured text)
- · LD (Ladder diagram)
- · FBD (Function block diagram)
- · IL (Instruction list)
- · SFC (Sequential function chart)
- CFC (Continuous Function Chart). CFC is an extension to the standard IEC programming languages

Machine Control Studio provides a complete environment for the development of user programs. Programs can be created, compiled and downloaded to a Digitax HD for execution, via the communications port on the front of the drive. The run-time operation of the compiled program on the target can also be monitored using Machine Control Studio and facilities are provided to interact with the program on the target by setting new values for target variables and parameters.

The Onboard PLC and Machine Control Studio form the first level of functionality in a range of programmable options for Digitax HD.

Machine Control Studio can be downloaded from www.drive-setup.com.

See the Machine Control Studio help file for more information regarding using Machine Control Studio, creating user programs and downloading user programs to the drive.

10.2 Benefits

The combination of the Onboard PLC and Machine Control Studio, means that the drive can replace nano and some micro PLCs in many applications Machine Control Studio benefits from access to function and function block libraries as well as those from third parties. Functions and function blocks available as standard in Machine Control Studio include, but not limited to, the following:

- Arithmetic blocks
- · Comparison blocks
- Timers
- Counters
- Multiplexers
- · Latches
- · Bit manipulation

Typical applications for the Onboard PLC include:

- · Ancillary pumps
- Fans and control valves
- Interlocking logic
- · Sequences routines
- · Custom control words.

10.3 Features

The Digitax HD Onboard PLC user program has the following features:

10.3.1 Tasks

The Onboard PLC allows use of two tasks.

Clock: A high priority real time task. The clock task interval can be set from 4 ms to 262 s in multiples of 4 ms. The parameter Onboard User Program: Clock Task Time Used (11.051) shows the percentage of the available time used by clock task. A read or write of a drive parameter by the user program takes a finite period of time. It is possible to select up to 10 parameters as fast access parameter which reduced the amount of time it takes for the user program to read from or write to a drive parameter. This is useful when using a clock task with a fast update rate as selecting a parameter for fast access reduces the amount of the clock task resource required to access parameters.

Freewheeling: A non-real time background task. The freewheeling task is scheduled for a short period once every 64 ms. The time for which the task is scheduled will vary depending on the loading of the drive's processor. When scheduled, several scans of the user program may be performed. Some scans may execute in microseconds. However, when the main drive functions are scheduled there will be a pause in the execution of the program causing some scans to take many milliseconds. The parameter *Onboard User Program: Freewheeling Tasks Per Second* (11.050) shows the number of times the freewheeling task has started per second.

10.3.2 Variables

The Onboard PLC supports the use of variables with the data types of Boolean, integer (8 bit, 16 bit and 32 bit, signed and unsigned), floating point (64 bit only), strings and time.

10.3.3 Custom menu

Machine Control Studio can construct a custom drive menu to reside in menu 30 on the drive. The following properties of each parameter can be defined using Machine Control Studio:

- · Parameter name
- · Number of decimal places
- The units for the parameter to be display on the keypad.
- · The minimum, maximum and default values
- Memory handling (i.e. power down save, user save or volatile)
- Data type. The drive provides a limited set of 1 bit, 8 bit, 16 bit and 32 bit integer parameters to create the customer menu.

Parameters in this customer menu can be accessed by the user program and will appear on the keypad.

10.3.4 Limitations

The Onboard PLC user program has the following limitations:

- The flash memory allocated to the Onboard PLC is 16 kB which includes the user program and its header which results in a maximum user program size of about 12 kB
- · The Onboard PLC is provided with 2 kB of RAM.
- The drive is rated for 100 program downloads. This limitation is imposed by the flash memory used to store the program within the drive.
- There is only one real-time task with a minimum period of 4 ms.
- The freewheeling background task runs at a low priority. The drive is
 prioritized to perform the clock task and its major functions first, e.g.
 motor control, and will use any remaining processing time to execute
 the freewheeling task as a background activity. As the drive's
 processor becomes more heavily loaded, less time is spent
 executing the freewheeling task.
- Breakpoints, single stepping and online program changes are not possible.
- · The Graphing tool is not supported.
- The variable data types REAL (32 bit floating point), LWORD (64 bit integer) and WSTRING (Unicode string), and retained variables are not supported.

10.4 Onboard PLC parameters

The following parameters are associated with the Onboard PLC user program.

11.	047	Onboard User Program: Enable							
RW	Txt				US				
Û	Stop	(0) or Ru	n (1)	\Rightarrow	Rui	n (1)			

I	Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	SD Card Operation	Onboard PLC	Advanced parameters	Diagnostics	UL listing information
	illioilliation	IIIIOIIIIalioii	IIIStaliation	IIIStaliation	Starteu	parameters	tile illotoi		Operation	FLO	parameters		IIIIOIIIIauc

This parameter stops and starts the user program.

0 - Stop the User Program

The onboard user program is stopped. If it is restarted by setting *Onboard User Program: Enable* (11.047) to a non-zero value the background task starts from the beginning.

1 - Run the User Program

The user program will execute.

11.	048	Onboard User Program: Status						
RO	Txt		NC	PT				
\$		47483648 14748364		\Rightarrow				

This parameter is read-only and indicates the status of the user program in the drive. The user program writes the value to this parameter.

- 0: Stopped
- 1: Running
- 2: Exception
- 3: No user program present

11.0	049	Onboard	Onboard User Program: Programming Events								
RO	Uni		NC	PT	PS						
Û		0 to 65535	5	\Rightarrow							

This parameter holds the number of times an Onboard PLC user program download has taken place and is 0 on dispatch from the factory. The drive is rated for one hundred program downloads. This parameter is not altered when defaults are loaded.

11.0	050	Onboard Second	User Pro	ogram: Fr	eewheeling	Tasks Per
RO	Uni		NC	PT		
\$	(0 to 65535	5	\Rightarrow		

This parameter shows the number of times the freewheeling task has started per second.

11.0	051	Onboard User Program: Clock Task Time Used								
RO			NC	PT						
\$	0.0	0 to 100.0	%	\Rightarrow						

This parameter shows the percentage of the available time used by the user program clock task.

11.0	055	Onboard Interval	User Pro	ogram: Cl	ock Task S	cheduled
RO			NC	PT		
\$	0 t	o 262128	ms	\Rightarrow		

This parameter shows the interval at which the clock task is scheduled to run at in ms.

10.5 Onboard PLC trips

If the drive detects an error in the user program it will initiate a User Program trip. The sub-trip number for the User Program trip details the reason for the error. See Chapter 12 *Diagnostics* on page 192 for more information on the User Program trip.

11 Advanced parameters

This is a quick reference to all parameters in the drive showing units, ranges limits etc, with block diagrams to illustrate their function. Full descriptions of the parameters can be found in the *Parameter Reference Guide*.

These advanced parameters are listed for reference purposes only. The lists in this chapter do not include sufficient information for adjusting these parameters. Incorrect adjustment can affect the safety of the system, and damage the drive and or external equipment. Before attempting to adjust any of these parameters, refer to the *Parameter Reference Guide*.

Operation mode abbreviations:

Open-loop: Sensorless control for induction motors

RFC-A: Asynchronous Rotor Flux Control for induction motors

RFC-S: Synchronous Rotor Flux Control for synchronous motors including permanent magnet motors.

Default abbreviations:

Standard default value (50 Hz AC supply frequency)

USA default value (60 Hz AC supply frequency)

NOTE

Parameter numbers shown in brackets {...} are the equivalent Menu 0 parameters. Some Menu 0 parameters appear twice since their function depends on the operating mode.

The Range - RFC-A / S column applies to both RFC-A and RFC-S. For some parameters, this column applies to only one of these modes, this is indicated accordingly in the Default columns.

In some cases, the function or range of a parameter is affected by the setting of another parameter. The information in the lists relates to the default condition of any parameters affected in this way.

Table 11-2 Key to parameter table coding

	Key to parameter table coding
Coding	Attribute
RW	Read/Write: can be written by the user
RO	Read only: can only be read by the user
Bit	1 bit parameter. 'On' or 'Off' on the display
Num	Number: can be uni-polar or bi-polar
Txt	Text: the parameter uses text strings instead of numbers.
Bin	Binary parameter
IP	IP Address parameter
Mac	Mac Address parameter
Date	Date parameter
Time	Time parameter
Chr	Character parameter
FI	Filtered: some parameters which can have rapidly changing values are filtered when displayed on the drive keypad for easy viewing.
DE	Destination: This parameter selects the destination of an input or logic function.
RA	Rating dependent: this parameter is likely to have different values and ranges with drives of different voltage and current ratings. Parameters with this attribute will be transferred to the destination drive by non-volatile storage media when the rating of the destination drive is different from the source drive and the file is a parameter file. However, the values will be transferred if only the current rating is different and the file is a difference from default type file.
ND	No default: The parameter is not modified when defaults are loaded
NC	Not copied: not transferred to or from non-volatile media during copying.
PT	Protected: cannot be used as a destination.
US	User save: parameter saved in drive EEPROM when the user initiates a parameter save.
PS	Power-down save: parameter automatically saved in drive EEPROM when the under volts (UV) state occurs.

Parameter ranges and Variable minimum/maximums 11.1

Some parameters in the drive have a variable range with a variable minimum and a variable maximum value which is dependent on one of the following:

The settings of other parameters

The drive rating

- The drive mode
- Combination of any of the above

The tables below give the definition of variable minimum/maximum and the maximum range of these.

VM_AC_V	OLTAGE Range applied to parameters showing AC voltage
Units	V
Range of [MIN]	0
Range of [MAX]	0 to 930
Definition	VM_AC_VOLTAGE[MAX] is drive voltage rating dependent. See Table 11-4.
	VM_AC_VOLTAGE[MIN] = 0

VM_AC_VOI	TAGE_SET Range applied to the AC voltage set-up parameters
Units	V
Range of [MIN]	0
Range of [MAX]	0 to 690
Definition	VM_AC_VOLTAGE[MAX] is drive voltage rating dependent. See Table 11-4.
Deminion	VM_AC_VOLTAGE[MIN] = 0

VM_ACC	Maximum applied to the ramp rate parameters
Units	s / 100 Hz, s / 1000 rpm, s / 1000 mm/s
Range of [MIN]	Open-loop: 0.0 RFC-A, RFC-S: 0.000
Range of [MAX]	Open-loop: 0.0 to 3200.0 RFC-A, RFC-S: 0.000 to 3200.000
Definition	Open-loop mode If Ramp Rate Units (02.039) = 0: VM_ACCEL_RATE[MAX] = 3200.0 If Ramp Rate Units (02.039) = 1: VM_ACCEL_RATE[MAX] = 3200.0 x Pr 01.006 / 100.0 VM_ACCEL_RATE[MIN] = 0.0 RFC-A, RFC-S modes If Ramp Rate Units (02.039) = 0: VM_ACCEL_RATE[MAX] = 3200.000 If Ramp Rate Units (02.039) = 1: VM_ACCEL_RATE[MAX] = 3200.000 x Pr 01.006 / 1000.0 VM_ACCEL_RATE[MAX] = 3200.000 x Pr 01.006 / 1000.0 VM_ACCEL_RATE[MIN] = 0.000 If the second motor map is selected (Pr 11.045 = 1) Pr 21.001 is used instead of Pr 01.006.

VM_AMC_JER	K_UNIPOLAR Range applied to the parameters showing the AMC jerk
Units	User units / ms / ms / ms
Range of [MIN]	0
Range of [MAX]	107374.1823
Definition	VM_AMC_JERK_UNIPOLAR[MAX] = 107374.1823 / AMC Auto Resolution Scaling (31.016) VM_AMC_JERK_UNIPOLAR[MIN] = 0

VM_DC_VOI	TAGE_SET Range applied to DC voltage reference parameters
Units	V
Range of [MIN]	0
Range of [MAX]	0 to 1150
Definition	VM_DC_VOLTAGE_SET[MAX] is drive voltage rating dependent. See Table 11-4 VM_DC_VOLTAGE_SET[MIN] = 0

VM_DRIVE	CURRENT	Range applied to parameters showing current in A
Units	Α	
Range of [MIN]	-99999.999 to 0.000	
Range of [MAX]	0.000 to 99999.999	
Definition	Scale Current Kc (11.061)	AX] is equivalent to the full scale (over current trip level) for the drive and is given by Full IIN] = - VM DRIVE CURRENT[MAX]

VM_DRIVE_CUR	RENT_UNIPOLAR Unipolar version of VM_DRIVE_CURRENT
Units	A
Range of [MIN]	0.000
Range of [MAX]	0.000 to 99999.999
Definition	VM_DRIVE_CURRENT_UNIPOLAR[MAX] = VM_DRIVE_CURRENT[MAX]
	VM_DRIVE_CURRENT_UNIPOLAR[MIN] = 0.000

VM_HIGH_DC_VOLTAGE		Range applied to parameters showing high DC voltage
Units	V	
Range of [MIN]	0	
Range of [MAX]	0 to 1500	
Definition		E[MAX] is the full scale d.c. link voltage feedback for the high d.c. link voltage measurement oltage if it goes above the normal full scale value. See Table 11-4.

VM_LOW	_UNDER_VOLTS	Range applied to the low under-voltage threshold
Units	V	
Range of [MIN]	24	
Range of [MAX]	24 to 1150	
Definition	If Back-up Mode En	_VOLTS[MAX] = VM_STD_UNDER_VOLTS[MIN] lable (06.068) = 1: _VOLTS[MAX] = VM_STD_UNDER_VOLTS[MIN] / 1.1.

VM_MIN_SWITCH	ING_FREQUENCY	Range applied to the minimum switching frequency parameter
Units	User units	
Range of [MIN]	0	
Range of [MAX]	0 to 6	
Definition		EQUENCY[MAX] = Maximum Switching Frequency (05.018) EQUENCY[MIN] = 0 for motor control modes, or 1 for Regen mode (subject to the

	R1_CURRENT_LIMIT Range applied to current limit parameters
VM_MOTOF	R2_CURRENT_LIMIT
Units	%
Range of [MIN]	0.0
Range of [MAX]	0.0 to 1000.0
	VM_MOTOR1_CURRENT_LIMIT[MIN] = 0.0
	Open-loop VM_MOTOR1_CURRENT_LIMIT[MAX] = (I_Tlimit / I_Trated) x 100 % Where: I_Tlimit = I_MaxRef x cos(sin^-1(I_Mrated / I_MaxRef)) I_Mrated = Pr 05.007 sin \(\phi \) I_Trated = Pr 05.007 x cos \(\phi \) cos \(\phi = Pr 05.010 \) I_MaxRef is 0.7 x Pr 11.061 when the motor rated current set in Pr 05.007 is less than or equal to Pr 11.032 (i.e. Heavy duty). RFC-A VM_MOTOR1_CURRENT_LIMIT[MAX] = (I_Tlimit / I_Trated) x 100 %
Definition	Where: $ \begin{aligned} & _{T_{limit}} = _{MaxRef} \times cos(sin^{-1}(I_{Mrated} / I_{MaxRef})) \\ & _{I_{Mrated}} = Pr \ \textbf{05.007} \times sin \ \phi_1 \\ & _{ITrated} = Pr \ \textbf{05.007} \times cos \ \phi_1 \\ & \phi_1 = cos-1 \ (Pr \ \textbf{05.010}) + \phi_2. \ \phi_1 \ is \ calculated \ during \ an \ autotune. See the \ variable \ minimum \ / \ maximum \ calculations \ in the \ \textit{Parameter Reference Guide} \ for \ more \ information \ regarding \ \phi_2. \\ & _{I_{MaxRef}} \ is \ 0.9 \times Pr \ \textbf{11.061} \ when \ the \ motor \ rated \ current \ set \ in \ Pr \ \textbf{05.007} \ is \ less \ than \ or \ equal \ to \ Pr \ \textbf{11.032} \ (i.e. \ Heavy \ duty). \end{aligned}$
	VM_MOTOR1_CURRENT_LIMIT[MAX] = (I _{MaxRef} / Pr 05.007) x 100 % Where: I _{MaxRef} is 0.9 x Pr 11.061 when the motor rated current set in Pr 05.007 is less than or equal to Pr 11.032 (i.e. Heavy duty).
	For VM_MOTOR2_CURRENT_LIMIT[MAX] use Pr 21.007 instead of Pr 05.007 and Pr 21.010 instead of Pr 05.010.

	/E_REF_CLAMP1 /E_REF_CLAMP2	ts applied to the positive frequency or speed reference clamp
Units	Open-loop: Hz RFC-A, RFC-S: rpm or mm/s	
Range of [MIN]	Open-loop: 0.0 RFC-A, RFC-S: 0.0	
Range of [MAX]	Open-loop: 550.0 RFC-A, RFC-S: 0.0 to 50000.0	
	(01.006), which in turn limit the lides not exceed the speed whe below. The limit is based on the possible to disable this limit if the that the motor can be operated mode. It should be noted that the	MAX] defines the range of the positive reference clamp, <i>Maximum Reference Clamp</i> references. In RFC-A and RFC-S modes a limit is applied so that the position feedback are the drive can no longer interpret the feedback signal correctly as given in the table position feedback device selected with <i>Motor Control Feedback Select</i> (03.026). It is a <i>RFC Feedback Mode</i> (03.024) ≥ 1 (i.e. VM_POSITIVE_REF_CLAMP1 = 50000.0), so at a speed above the level where the drive can interpret the feedback in sensorless e position feedback device itself may have a maximum speed limit that is lower than would be taken not to exceed a speed that would cause damage to the position feedback
	Feedback device	VM_POSITIVE_REF_CLAMP1[MAX]
	AB, AB Servo	(500 kHz x 60 / rotary lines per revolution) rpm (500 kHz x linear line pitch in mm) mm/s
Definition	FD, FR, FD Servo, FR Servo	(500 kHz x 60 / rotary lines per revolution)/2 rpm (500 kHz x linear line pitch in mm)/2 mm/s
Schillion	SC, SC Hiper, SC EnDat, SC SSI, SC Servo	(500 kHz x 60 / sine waves per revolution) rpm (500 kHz x linear line pitch in mm) mm/s
	Resolver	(250 Hz x 60) rpm (250 Hz x pole pitch in mm) mm/s
	Any other device	50000.0 rpm or mm/s
	In open-loop mode VM_POSITI	VE_REF_CLAMP1[MAX] is fixed at 550.0 Hz
		the speed reference of 550 \times 60 / Motor pole pairs. Therefore, with a 4 pole motor the LAMP1[MAX] will be 16,500 rpm.
	VM_POSITIVE_REF_CLAMP1[MIN] = 0.0
		is defined in the same way as VM_POSITIVE_REF_CLAMP1 except [MAX] defines the range of the positive reference clamp, M2 Maximum Reference mits the references.

	VM_POWER	Range applied to parameters that either set or display power
Units	kW	
Range of [MIN]	-99999.999 to 0.000	
Range of [MAX]	0.000 to 99999.999	
Definition	with maximum a.c. output	ng dependent and is chosen to allow for the maximum power that can be output by the drive voltage, at maximum controlled current and unity power factor. VM_AC_VOLTAGE[MAX] x VM_DRIVE_CURRENT[MAX] / 1000 POWER[MAX]

VM_RATED	CURRENT	Range applied to rated current parameters
Units	Α	
Range of [MIN]	0.000	
Range of [MAX]	0.000 to 99999.999	
Definition	Heavy Duty rating of the d	
	VM_RATED_CURRENT [I	MIN] = 0.000

VM_REGEN	REACTIVE	Range applied to the reactive current reference in Regen mode
Units	%	
Range of [MIN]	-1000.0 to 0.0	
Range of [MAX]	0.0 to 1000.0	
Definition	reference does not exceed	MAX] Applies a limit to the reactive current reference in Regen mode so that the total current its maximum allowed level.
	VM_REGEN_REACTIVE	MIN] = - VM_REGEN_REACTIVE[MAX]

V	M_SPEED	Range applied to parameters showing speed
Units	Open-loop, RFC	-A, RFC-S: rpm or mm/s
Range of [MIN]	Open-loop, RFC	-A, RFC-S: -50000.0 to 0.0
Range of [MAX]	Open-loop, RFC	-A, RFC-S: 0.0 to 50000.0
		nimum/maximum defines the range of speed monitoring parameters. To allow headroom for overshoot to twice the range of the speed references.
Definition	VM_SPEED[MA	X] = 2 x VM_SPEED_FREQ_REF[MAX]
	VM_SPEED[MIN	I] = 2 x VM_SPEED_FREQ_REF[MIN]

VM_SPEED_	Range applied to the keypad reference
Units	Open-loop: Hz RFC-A, RFC-S: rpm or mm/s
Range of [MIN]	Open-loop: -550.0 to 550.0 RFC-A, RFC-S: -50000.0 to 50000.0
Range of [MAX]	Open-loop: 0.0 to 550.0 RFC-A, RFC-S: 0.0 to 50000.0
1	This variable maximum is applied to Keypad Control Mode Reference (01.017). The maximum applied to these
	parameters is the same as other frequency reference parameters. VM_SPEED_FREQ_USER_REFS [MAX] = VM_SPEED_FREQ_REF[MAX] However the minimum is dependent on Negative Reference Clamp Enable (01.008) and Bipolar Reference Enable (01.010). Negative Reference Bipolar Reference
Definition	VM_SPEED_FREQ_USER_REFS [MAX] = VM_SPEED_FREQ_REF[MAX] However the minimum is dependent on Negative Reference Clamp Enable (01.008) and Bipolar Reference Enable
Definition	VM_SPEED_FREQ_USER_REFS [MAX] = VM_SPEED_FREQ_REF[MAX] However the minimum is dependent on Negative Reference Clamp Enable (01.008) and Bipolar Reference Enable (01.010). Negative Reference
Definition	VM_SPEED_FREQ_USER_REFS [MAX] = VM_SPEED_FREQ_REF[MAX] However the minimum is dependent on Negative Reference Clamp Enable (01.008) and Bipolar Reference Enable (01.010). Negative Reference Clamp Enable (01.008) Bipolar Reference Enable (01.010)
Definition	VM_SPEED_FREQ_USER_REFS [MAX] = VM_SPEED_FREQ_REF[MAX] However the minimum is dependent on Negative Reference Clamp Enable (01.008) and Bipolar Reference Enable (01.010). Negative Reference Clamp Enable (01.008)

VM_SPEED_FREQ_REF		Range applied to the frequency or speed reference parameters			
Units	Open-loop: Hz RFC-A, RFC-S: rpm	or mm/s			
Range of [MIN]		Open-loop: -550.0 to 0.0 RFC-A, RFC-S: -50000.0 to 0.0			
Range of [MAX]		Open-loop: 0.0 to 550.0 RFC-A, RFC-S: 0.0 to 50000.0			
Definition	If Pr 01.008 = 1: VM If the second motor r Pr 01.007 .	_SPEED_FREQ_REF[MAX] = Pr 01.006 _SPEED_FREQ_REF[MAX] = Pr 01.006 or Pr 01.007 , whichever is larger. map is selected (Pr 11.045 = 1) Pr 21.001 is used instead of Pr 01.006 and Pr 21.002 instead of _REF[MIN] = -VM_SPEED_FREQ_REF[MAX].

Safety Product Mechanical Electrical Getting Basic Running SD Card Onboard **UL** listing Advanced Optimization Diagnostics Operation parameters information information installation installation started parameters the motor PLC

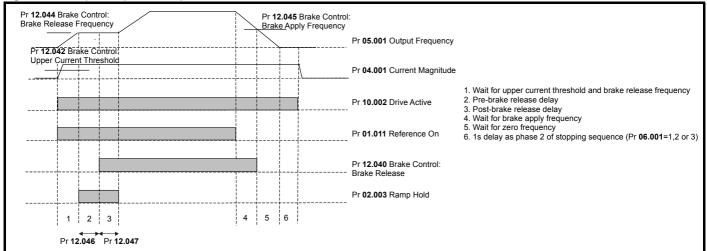

The brake control functions are provided to allow well co-ordinated operation of an external brake with the drive. While both hardware and software are designed to high standards of quality and robustness, they are not intended for use as safety functions, i.e. where a fault or failure would result in a risk of injury. In any application where the incorrect operation of the brake release mechanism could result in injury, independent protection devices of proven integrity must also be incorporated.

^{*}The position controller is disabled and the error integrator is also reset under the following conditions:

- 1. If the drive is disabled (i.e. inhibited, ready or tripped)
- 2. If the position controller mode (Pr 13.010) is changed. The position controller is disabled transiently to reset the error integrator.
- 3. The absolute mode parameter (Pr 13.011) is changed. The position controller is disabled transiently to reset the error integrator.
- 4. One of the position sources is invalid.
- 5. The position feedback initialized parameter (Pr 03.048) is zero.

Safety Running Product Mechanical Electrical Getting Basic SD Card Onboard Advanced **UL** listing Optimization Diagnostics information started parameters the motor

12 **Diagnostics**

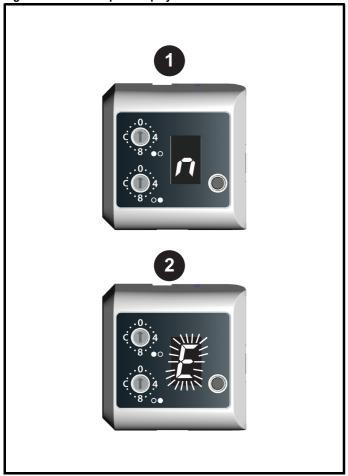

The KI-Compact Display and KI Remote Keypad RTC provide drive status information and drive trip indication for fault diagnosis.

Users must not attempt to repair a drive if it is faulty, nor carry out fault diagnosis other than through the use of the diagnostic features described in this chapter. If a drive is faulty, it must be returned to an authorized

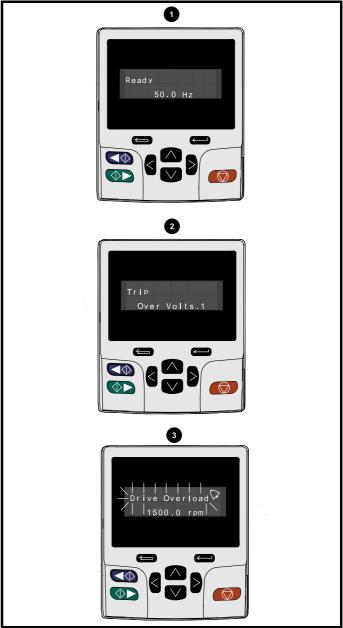

Status modes (KI-Compact Display, 12.1 KI-Remote Keypad and drive LED status)

Figure 12-3 Location of the status LED

- 1. Non flashing: Normal status
- 2. Flashing: Trip status

12.2 Trip indications

The output of the drive is disabled under any trip condition so that the drive stops controlling the motor. If the motor is running when the trip occurs it will coast to a stop.

During a trip condition, where a KI-Compact Display is being used, a trip or HF (hardware fault) condition is indicated as a scrolling message, with an E prefix followed by a serial communications trip code and sub trip code where relevant. Refer to Table 12-1 for further information.

Table 12-1 Trips associated with xxyzz sub-trip number

Display character	Trip code	Separator	Sub-trip code
E	Range 1 to 254	•	Range 1 to 65535
HF	Range 1 to 99		

During a trip condition, where a KI-Remote Keypad is being used, the upper row of the display indicates that a trip has occurred and the lower row of the keypad display will display the trip string. Some trips have a sub-trip number to provide additional information about the trip. If a trip has a sub-trip number, the sub-trip number is flashed alternately with the trip string unless there is space on the second row for both the trip string and the sub-trip number in which case both the trip string and sub-trip information is displayed separated by a decimal place.

If a display is not being used, the drive LED Status indicator will flash with 0.5 s duty cycle if the drive has tripped. Refer to Figure 12-3.

Trips are listed alphabetically in Table 12-4 based on the trip indication shown on the drive display. Alternatively, the drive status can be read in Pr 10.001 'Drive OK' using communication protocols. The most recent trip can be read in Pr 10.020 providing a trip number. It must be noted that the hardware trips (HF01 to HF20) do not have trip numbers. The trip number must be checked in Table 12-5 to identify the specific trip

Example

- 1. Trip code 2 is read from Pr 10.020 via serial communications.
- 2. Checking Table 12-4 shows Trip 2 is an Over Volts trip.

- 3. Look up Over Volts in Table 12-4.
- 4. Perform checks detailed under Diagnosis.

12.3 Identifying a trip / trip source

Some trips only contain a trip string whereas some other trips have a trip string along with a sub-trip number which provides the user with additional information about the trip.

A trip can be generated from a control system or from a power system. The sub-trip number associated with the trips listed in Table 12-2 is in the form xxyzz and used to identify the source of the trip.

Table 12-2 Trips associated with xxyzz sub-trip number

•	•
Over Volts	OHt dc bus
OI ac	Phase Loss
OI Brake	Power Comms
PSU	OI Snubber
OHt Inverter	Temp Feedback
OHt Power	Power Data
OHt Control	

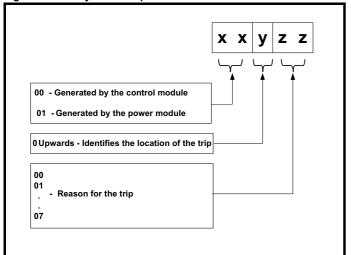

The digits xx are 00 for a trip generated by the control system. For a single drive (not part of a multi-power module drive), if the trip is related to the power system then xx will have a value of 01, when displayed the leading zeros are suppressed.

The y digit is used to identify the location of a trip which is generated by a rectifier module connected to a power module (if xx is non zero). For a control system trip (xx is zero), the y digit, where relevant is defined for each trip. If not relevant, the y digit will have a value of zero.

The zz digits give the reason for the trip and are defined in each trip description.

Safety	Product	Mechanical	Electrical	Getting	Basic	Runnina	0	SD Card	Onboard	Advanced		UL listing
information	information	installation	installation	started	parameters	the motor	Optimization	Operation	PLC	parameters	Diagnostics	information

Figure 12-4 Key to sub-trip number

For example, if the drive has tripped and the lower line of the display shows 'OHt Control.2', with the help of Table 12-3 below the trip can be interpreted as; an over temperature has been detected; the trip was generated by fault in the control module, the control board thermistor 2 over temperature. For further information on individual sub-trips, refer to the diagnosis column in Table 12-4.

Table 12-3 Sub-trip identification

	Recommend		
		e trip and perform a parameter save to accept the	
Autotune 1		dback did not change or required speed could	
	The drive has	s tripped during an autotune. The cause of the trip	can be identified from the sub-trip number.
	Sub-trip	Reason	Recommended actions
		The position feedback did not change when	Ensure that the motor is free to turn (i.e. mechanical
		position feedback is being used during rotating	brake is released).
		auto-tune.	Check that the position feedback is selected correctly and operates correctly.
		The motor did not reach the required speed during mechanical load measurement.	Ensure that the motor is free to turn and that the static load plus inertia is not too large for the drive to accelerate within the test time.
	3	The required commutation signal edge could not be found during a rotating auto-tune with a Commutation Only position feedback device.	Check that the position feedback signals are connected correctly.
	4	The required movement angle cannot be produced during a minimal movement test.	Reduce the angular movement required.
11	5	The second part of the minimal movement test during auto-tuning cannot locate the motor flux position accurately.	Reduce the angular movement required.
	6	The phasing offset angle is measured twice during a stationary auto-tune and the results are not within 30° of each other.	If a minimal movement test is being used and excessiv motor movement is occurring during the test reduce the required angle movement. Otherwise try and increase the required angle movement.
	7	The motor is moving when a phasing test on enable is selected and the drive is enabled, but the motor is still moving at a speed above the zero speed threshold.	Ensure that the motor is stationary before the drive is enabled.
	11 8 1	An auto-tune has been attempted while the AMC is selected.	Set AMC Select (31.001) to zero to deselect the AMC.
	Ensure PCheck fe	led actions: ne motor is free to turn i.e. mechanical brake was r 03.026 and Pr 03.038 are set correctly (or appreedback device wiring is correct necoder mechanical coupling to the motor

UL listing Safety Product Mechanical Electrical Getting Basic Running SD Card Advanced Onboard Optimization Diagnostics nformaťio installation started parameter the moto Operation PLC

Trip Diagnosis **EEPROM Fail** Default parameters have been loaded The EEPROM Fail trip indicates that default parameters have been loaded. The exact cause/reason of the trip can be identified from the sub-trip number. Sub-trip Reason The most significant digit of the internal parameter database version number has changed 1 The CRCs applied to the parameter data stored in internal non-volatile memory indicate that a valid set 2 of parameters cannot be loaded The drive mode restored from internal non-volatile memory is outside the allowed range for the product 3 or the derivative image does not allow the previous drive mode 4 The drive derivative image has changed 5 The power stage hardware has changed 6 The internal I/O hardware has changed 7 The position feedback interface hardware has changed 8 The control board hardware has changed 9 The checksum on the non-parameter area of the EEPROM has failed 31 The drive holds two banks of user save parameters and two banks of power down save parameters in non-volatile memory. If the last bank of either set of parameters that was saved is corrupted a User Save or Power Down Save trip is produced. If one of these trips occurs the parameters values that were last saved successfully are used. It can take some time to save parameters when requested by the user and if the power is removed from the drive during this process it is possible to corrupt the data in the non-volatile memory. If both banks of user save parameters or both banks of power down save parameters are corrupted or one of the other conditions given in the table above occurs EEPROM Fail.xxx trip is produced. If this trip occurs it is not possible to use the data that has been saved previously, and so the drive will be in lowest allowed drive mode with default parameters. The trip can only be reset if Pr mm.000 (mm.000) is set to 10, 11, 1233 or 1244 or if Load Defaults (11.043) is set to a non-zero value. Recommended actions: Default the drive and perform a reset Allow sufficient time to perform a save before the supply to the drive is removed If the trip persists - return drive to supplier **Encoder 1** Drive position feedback interface power supply overload The Encoder 1 trip indicates that the drive encoder power supply has been overloaded. Terminals 13 &14 of the 15 way D type connector can supply a maximum current of 200 mA @ 15 V or 300 mA @ 8 V and 5 V. Recommended actions: Check encoder power supply wiring 189 Disable the termination resistors (Pr 03.039 set to 0) to reduce current consumption For 5 V encoders with long cables, select 8 V (Pr 03.036) and install a 5 V voltage regulator close to the encoder Check the encoder specification to confirm if it is compatible with the encoder port power supply current capability Replace the encoder Use an external power supply with higher current capability **Encoder 2** Drive encoder (Feedback) wire break The Encoder 2 trip indicates that the drive has detected a wire break on the 15 way D-type connector on the drive. The exact cause of the trip can be identified from the sub-trip number. Sub-trip Reason 1 Drive position feedback interface 1 on any input 2 Drive position feedback interface 2 on any input 11 Drive position feedback interface 1 on the A channel 12 Drive position feedback interface 1 on the B channel 190 13 Drive position feedback interface 1 on the Z channel Recommended actions: Ensure that the position feedback device type selected in Pr 03.038 is correct for the position feedback device connected to the P1 interface on the drive. If wire break detection on the drive encoder input is not required, set Pr 03.040 = XXX0 to disable the Encoder 2 trip Check cable continuity Check wiring of feedback signals is correct Check encoder power supply is set correctly (Pr 03.036) Replace encoder

Trip Diagnosis Inductance Inductance measurement out of range or motor saturation not detected This trip occurs in RFC-S mode when the drive has detected that the motor inductances are not suitable for the operation being attempted. The trip is either caused because the ratio or difference between Ld and Lq is too small or because the saturation characteristic of the motor cannot be measured. If the inductance ratio or difference is too small this is because one of the following conditions is true: $(No-load\ Lq\ (05.072)-\ Ld\ (05.024))\ /\ Ld\ (05.024)<0.1$ (No-load Lg (05.072) - Ld (05.024)) < (K / Full Scale Current Kc (11.061))H Drive Rated voltage (11.033) Κ 200 V 0.0073 400 V 0.0146 575 V 0.0174 690 V 0.0209 If the saturation characteristic of the motor cannot be measured this is because when the flux in the motor is changed the measured value of Ld does change sufficiently due to saturation to be measured. When half of Rated Current (05.007) is applied in the d axis of the motor in each direction the inductance must fall change at least (K / (2 x Full Scale Current Kc (11.061)). The specific reasons for each of the sub-trips are given in the table below: Sub-trip Reason The inductance ratio or difference is too small when the drive has been started in sensorless mode. The saturation characteristic of the motor cannot be measured when the drive has been started in sensorless mode The inductance ratio or difference is too small when an attempt is made to determine the location of the motor flux during a stationary auto-tune in RFC-S mode. This trip is also produced when the inductance ratio or inductance difference is too small when carrying out a phasing test on starting in RFC-S mode. If position 3 feedback is being used the measured value for Position Feedback Phase Angle (03.025) may not be reliable. Also the measured values of Ld (05.024) and No-load Lq (05.072) may not correspond to the d and q axis respectively. The direction of the flux in the motor is detected by the change of inductance with different currents. This trip is initiated if the change cannot be detected when an attempt is made to perform a stationary auto-tune when position feedback is being used, or to perform a phasing test on starting in RFC-S mode. Recommended actions for sub-trip 1: Ensure that RFC Low Speed Mode (05.064) is set to Non-salient (1), Current (2) or Current No test (3). Recommended actions for sub-trip 2: Ensure that RFC Low Speed Mode (05.064) is set to Non-salient (1), Current (2) or Current No test (3). Recommended actions for sub-trip 3: None. The trip acts as a warning. Recommended actions for sub-trip 4: Stationary autotune is not possible. Perform a minimal movement or rotating autotune. Phasing test on starting is not possible. Use a position feedback device with commutation signals or absolute position. I/O Overload Digital output overload The I/O Overload trip indicates that the total current drawn from 24 V user supply or from the digital output has exceeded the limit. A trip is initiated if one or more of the following conditions: Maximum output current from one digital output is 100 mA. The combined maximum output current from outputs 1 and 2 is 100 mA 26 The combined maximum output current from output 3 and +24 V output is 100 mA Recommended actions: Check total loads on digital outputs Check control wiring is correct Check output wiring is undamaged **Keypad Mode** Keypad has been removed when the drive is receiving the speed reference from the keypad The Keypad Mode trip indicates that the drive is in keypad mode [Reference Selector (01.014) = 4 or 6 or M2 reference selector (21.003 = 4 or 6 if motor map 2 is selected) and the keypad has been removed or disconnected from the drive. 34 Recommended actions: Re-install keypad and reset Change Reference Selector (01.014) to select the reference from another source

OHt dc bus DC bus over temperature The OHt dc bus trip indicates a DC bus component over temperature based on a software thermal model. The drive includes a thermal protection system to protect the DC bus components within the drive. This includes the effects of the output current and DC bus ripple. The estimated temperature is displayed as a percentage of the trip level in Pr 07.035. If this parameter reaches 100 % then an OHt dc bus trip with sub-trip 200 is initiated. The drive will attempt to stop the motor before tripping. If the motor does not stop in 10 seconds the drive trips immediately. Source Description хx ΖZ 2 00 00 Control system DC bus thermal model gives trip with sub-trip 0 It is also possible in a multi-power module system for DC bus over-temperature to be detected from within the power stage. From this source the estimated temperature as a percentage of trip is not available and the trip is indicated as follows: Source Description XX ΖZ 00 Control system 01 0 Power stage gives trip with sub-trip 0 Recommended actions: Check the AC supply voltage balance and levels 27 Check DC bus ripple level Reduce duty cycle Reduce motor load Check the output current stability. If unstable; Check the motor map settings with motor nameplate (Pr 05.006, Pr 05.007, Pr 05.008, Pr 05.009, Pr 05.010, Pr **05.011**) - (All Modes) Disable slip compensation (Pr 05.027 = 0) – (Open loop) Disable dynamic V to F operation (Pr **05.013** = 0) - (Open loop) Select fixed boost (Pr **05.014** = Fixed) – (Open loop) Select high stability space vector modulation (Pr **05.020 = 1**) – (Open loop) Disconnect the load and complete a rotating auto-tune (Pr 05.012) - (RFC-A, RFC-S) Auto-tune the rated speed value (Pr 05.016 = 1) - (RFC-A, RFC-S) Reduce speed loop gains (Pr 03.010, Pr 03.011, Pr 03.012) - (RFC-A, RFC-S) Add a speed feedback filter value (Pr 03.042) - (RFC-A, RFC-S) Add a current demand filter (Pr 04.012) - (RFC-A, RFC-S) Check encoder signals for noise with an oscilloscope (RFC-A, RFC-S) Check encoder mechanical coupling - (RFC-A, RFC-S) **OHt Inverter** Inverter over temperature based on thermal model This trip indicates that an IGBT junction over-temperature has been detected based on a software thermal model. The subtrip indicates which model has initiated the trip in the form xxyzz as given below: Description Source XX 77 Control system 00 1 00 Inverter thermal model Control system 00 3 00 Braking IGBT thermal model Recommended actions with sub-trip 100: 21 Reduce the selected drive switching frequency Ensure Auto-switching Frequency Change Disable (05.035) is set to Off Reduce duty cycle Increase acceleration / deceleration rates Reduce motor load Check DC bus ripple Ensure all three input phases are present and balanced Recommended actions with sub-trip 300:

Reduce the braking load

Trip OHt Power Power stage over temperature This trip indicates that a power stage over-temperature has been detected. From the sub-trip 'xxyzz', the This trip indicates that a power stage over-temperature is identified by 'zz'. The thermistor numbering is different to location which is indicating the over-temperature is identified by 'zz'. The thermistor numbering is different to module type drive (i.e. no parallel board fitted) and a multi-module type drive (i.e. parallel board fitted with on power modules) as shown below: Single module type drive: Source xx y zz Description Power system 01 0 zz Thermistor location defined by zz in the power power my system 01 Rectifier number zz Thermistor location defined by zz in the rectified Multi-module type system: Source xx y zz Description Power system power module number 0 01 U phase power device Power system power module number 0 02 V phase power device Power system power module number 0 03 W phase power device Power system power module number 0 04 Rectifier Power system power module number 0 05 General power system Power system power module number 0 00 Braking IGBT Note that the power module that has caused the trip cannot be identified except for the braking IGBT tempe measurement Recommended actions: • Check enclosure / drive fans are still functioning correctly • Force the heatish fans to run at maximum speed • Check enclosure eventilation paths • Check enclosure eventilation paths • Check enclosure down filters • Increase acceleration / deceleration rates • Use S ramp (Pr Q2.066) • Reduce the drive switching frequency • Reduce motor load • Check the de	Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Opt	imization	SD Card Operation	Onboard PLC	Advanced parameters	Diagnostics	UL listing informatio
Power stage over temperature This trip indicates that a power stage over-temperature has been detected. Reduce the values in the speed loop gain parameters - (Pr 03.010, 03.011, 03.012) or (Pr 03.013, 03.014, 03.015)

Has the phase angle autotune been completed? (RFC-S mode only)

Reduce the values in current loop gain parameters (RFC-A, RFC-S modes only)

Safety Product Mechanical Electrical Getting Basic Running SD Card **UL** listing Onboard Advanced Optimization **Diagnostics** nformaťio installation started paramete the moto Operation PLC parameters Trip Diagnosis OI Brake Braking IGBT over current detected: short circuit protection for the braking IGBT activated The OI Brake trip indicates that over current has been detected in braking IGBT or braking IGBT protection has been activated. This trip cannot be reset until 10 s after the trip was initiated Source ХX Description Power module number 0 00 Braking IGBT instantaneous over-current trip Power system 4 Recommended actions: Check brake resistor wiring Check braking resistor value is greater than or equal to the minimum resistance value Check braking resistor insulation OI dc Power module over current detected from IGBT on state voltage monitoring The OI dc trip indicates that the short circuit protection for the drive output stage has been activated. The table below shows where the trip has been detected. This trip cannot be reset until 10 s after the trip was initiated. Source хx У ΖZ Control system 00 0 00 109 Power module number 0 00 Power system Recommended actions: Disconnect the motor cable at the drive end and check the motor and cable insulation with an insulation tester Replace the drive OI Snubber Snubber over-current detected The OI Snubber trip indicates that an over-current condition has been detected in the rectifier snubber circuit. The reason for the trip can be identified by the sub-trip number. Source ХX ZZ Description 00 Power system 01 Rectifier number Rectifier snubber over-current trip detected. * For a parallel power-module system the rectifier number will be one as it is not possible to determine which rectifier has detected the fault 92 Recommended actions: Ensure the internal EMC Filter is installed Ensure the motor cable length does not exceed the maximum for selected switching frequency Check for supply voltage imbalance Check for supply disturbance such as notching from a DC drive Check the motor and motor cable insulation with an insulation tester Install an output line reactor or sinusoidal filter **Option Disable**

Option module does not acknowledge during drive mode changeover

The Option Disable trip indicates that the option module did not acknowledge to the drive that communications with the drive has been stopped during the drive mode changeover with in the allocated time.

215

Recommended trip:

- Reset the trip
- If the trip persists, replace the option module

Out Phase Loss

Output phase loss detected

The Out Phase Loss trip indicates that phase loss has been detected at the drive output.

Sub-trip	Reason
1	U phase detected as disconnected when drive enabled to run.
2	V phase detected as disconnected when drive enabled to run.
3	W phase detected as disconnected when drive enabled to run.
4	Output phase loss detected when the drive is running.

98

If Pr 05.042 = 1 the physical output phases are reversed, and so sub-trip 3 refers to physical output phase V and sub-trip 2 refers to physical output phase W.

Recommended actions:

- Check motor and drive connections
- To disable the trip set Output Phase Loss Detection Enable (06.059) = 0

Trip Diagnosis RFC-S mode phasing failure due to incorrect phase angle **Phasing Error** The Phasing Error trip indicates that the phase offset angle in Pr 03.025 (or Pr 21.020 if the second motor map is being used) is incorrect if position feedback is being used and the drive is unable to control the motor correctly. Recommended actions: Check the encoder wiring Check the encoder signals for noise with an oscilloscope Check the encoder mechanical coupling Perform an auto-tune to measure the encoder phase angle or manually enter the correct phase angle into Pr 03.025 198 Spurious Phasing Error trips can sometimes be seen in very dynamic applications. This trip can be disabled by setting the over-speed threshold in Pr 03.008 to a value greater than zero. If sensorless control is being used this indicates that significant instability has occurred and the motor has accelerated without control. Recommended actions: Ensure that the motor parameters are set-up correctly. Reduce the speed controller gains. **Power Comms** Communication has been lost / errors detected between power, control and rectifier modules A Power Comms trip indicates a communications problem within the power system of the drive. The reason for the trip can be identified by the sub-trip number. Type of drive хx Single power Rectifier 01 00: Excessive communications errors detected by the rectifier module. module system number* 90 * For a parallel power-module system the rectifier number will be one as it is not possible to determine which rectifier has detected the fault Recommended actions: Hardware fault - Contact the supplier of the drive **Power Data** Power system configuration data error The Power Data trip indicates that there is an error in the configuration data stored in the power system. Source ٧ Description Control O OΩ 02 There is no data table to be uploaded to the control board system The power system data table is bigger than the space available in Control 00 0 03 the control pod to store it. system Control 00 0 04 The size of the table given in the table is incorrect. system Control 0 05 00 Table CRC error. system The version number of the generator software that produced the table is too low. i.e. a table from a newer generator is required that Control 00 0 06 system includes features that have been added to the table that may not 220 be present. Control The power board data table does not match the power board 00 0 07 hardware identifier. system The power data table used internally by the power module has an Power 0 01 00 error. (For a multi-power module drive this indicates any error with system the code tables in the power system). The power data table that should be uploaded to the control Power 0 01 01 system on power up has an error. system Power The power data table used internally by the power module does 0 01 02 system not match the hardware identification of the power module.

Recommended actions:

Hardware fault - Contact the supplier of the drive

Power Down Save

Power down save error

volatile memory.

37

The Power Down Save trip indicates that an error has been detected in the power down save parameters saved in non-

Recommended actions:

Perform a 1001 save in Pr mm.000 to ensure that the trip doesn't occur the next time the drive is powered up.

Trip Diagnosis PSU Internal power supply fault The PSU trip indicates that one or more internal power supply rails are outside limits or overloaded.														
PSU Internal power supply fault The PSU trip indicates that one or more internal power supply rails are outside limits or overloaded.	The <i>PSU</i> trip indicates that one or more internal power supply rails are outside limits or overloaded.													
The <i>PSU</i> trip indicates that one or more internal power supply rails are outside limits or overloaded.

Trip		Diagnosis	
User Program	On board us	ser program error	
		ogram trip indicates that an error has been detected in the	onboard user program image. The reason for the trip
		ified by the sub-trip number.	
	Sub-trip	Reason	Comments
	1 2	Divide by zero	
		Undefined trip Attempted fast parameter access set-up with non-existent	
	3	parameter	
	4	Attempted access to non-existent parameter	
	5	Attempted on ever range write	
	7	Attempted an over-range write Attempted read from write-only parameter	
	l - '	The image has failed because either its CRC is incorrect, or	
	30	there are less than 6 bytes in the image or the image header version is less than 5.	Occurs when the drive powers-up or the image is programmed. The image tasks will not run
	31	The image requires more RAM for heap and stack than can be provided by the drive.	As 30
	32	The image requires an OS function call that is higher than the maximum allowed	As 30
	33	The ID code within the image is not valid	As 30
	40	The timed task has not completed in time and has been suspended	Onboard User Program: Enable (11.047) is reset to zero when the trip is initiated
	41	Undefined function called, i.e. a function in the host system vector table that has not been assigned.	As 40
	52	Customized menu table CRC check failed	As 30
	53	Customized menu table changed	Occurs when the drive powers-up or the image is programmed and the table has changed. Defaults are loaded for the user program menu and the trip will keep occurring until drive parameters are saved.
249	80	Image is not compatible with the control board	Initiated from within the image code
	81	Image is not compatible with the control board serial number	As 80
	100	Image has detected and prevented attempted pointer access outside of the IEC task's heap area.	
	101	Image has detected and prevented misaligned pointer usage.	
	102	Image has detected an array bounds violation and prevented its access.	
	103	Image has attempted to convert a data type to or from an unknown data type, has failed and has shut itself down.	
	104	Image has attempted to use an unknown user service function.	
	200	User program has invoked a "divide" service with a denominator of zero. (Note that this is raised by the downloaded image and has therefore been given a distinct error code despite being the same fundamental problem as sub-trip 1.)	
	201	Parameter access is not supported. An attempt to read database other than the host drive.	
	202	Parameter does not exist. Database was host drive but the specified parameter does not exist.	
	203	Parameter is read-only.	
	204	Parameter is write-only.	
	205	Unknown parameter error.	
	206	Invalid bit present in parameter. The parameter does not contain the specified bit.	
	207	Parameter format lookup failed. Failed to get parameter information data.	
	208	An over-range write has been attempted.	
Usor Brog Trip	Trip gamer-	tod by an onboard user program	
User Prog Trip	. •	ted by an onboard user program be initiated from within an onboard user program using a	function call which defines the sub-trip number.
96		ded actions:	
	Check th	ne user program

information	information	installation	installation	started	parameters	the motor	Optimization	Operation	PLC	parameters	Diagnostics	information

Trip	Diagnosis
User Save	User Save error / not completed
	The <i>User Save</i> trip indicates that an error has been detected in the user save parameters saved in non-volatile memory. For example, following a user save command, If the power to the drive was removed when the user parameters were being saved.
36	Recommended actions:
	 Perform a user save in Pr mm.000 to ensure that the trip doesn't occur the next time the drive is powered up. Ensure that the drive has enough time to complete the save before removing the power to the drive.
User Trip	User generated trip
40.00	These trips are not generated by the drive and are to be used by the user to trip the drive through an application program.
40 -89 112 -159	Recommended actions:
112 100	Check the user program
Watchdog	Control word watchdog has timed out
	The Watchdog trip indicates that the control word has been enabled and has timed out.
	Recommended actions:
30	Once Pr 06.042 bit 14 has been changed from 0 to 1 to enable the watchdog, this must be repeated every 1 s or a Watchdog trip will be initiated. The watchdog is disabled when the trip occurs and must be re-enabled if required when the trip is reset.

The trips can be grouped into the following categories. It should be noted that a trip can only occur when the drive is not tripped or is already tripped but with a trip with a lower priority number.

Table 12-6 Trip categories

Priority	Category	Trips	Comments
1	Internal faults	HFxx	These indicate internal problems and cannot be reset. All drive features are inactive after any of these trips occur. If an KI-Keypad is installed it will show the trip, but the keypad will not function.
1	Stored HF trip	{Stored HF}	This trip cannot be cleared unless 1299 is entered into <i>Parameter</i> (mm.000) and a reset is initiated.
2	Non-resettable trips	Trip numbers 218 to 247, {Slot1 HF}, {Slot2 HF}, {Slot3 HF} or {Slot4 HF}	These trips cannot be reset.
3	Volatile memory failure	{EEPROM Fail}	This can only be reset if Parameter mm.000 is set to 1233 or 1244, or if Load Defaults (11.043) is set to a non-zero value.
4	SD Card trips	Trip numbers 174, 175 and 177 to 188	These trips are priority 5 during power-up.
4	Internal 24V and position feedback interface power supply	{PSU 24V} and {Encoder 1}	These trips can override {Encoder 2} to {Encoder 6} trips.
5	Trips with extended reset times	{OI ac}, {OI Brake}, and OI dc}	These trips cannot be reset until 10 s after the trip was initiated.
5	Phase loss and d.c. link power circuit protection	{Phase Loss} and {Oht dc bus}	The drive will attempt to stop the motor before tripping if a {Phase Loss}. 000 trip occurs unless this feature has been disabled (see <i>Action On Trip Detection</i> (10.037). The drive will always attempt to stop the motor before tripping if an {Oht dc bus} occurs.
5	Standard trips	All other trips	

12.5 Internal / Hardware trips

Trips {HF01} to {HF25} are internal faults that do not have trip numbers. If one of these trips occurs, the main drive processor has detected an irrecoverable error. All drive functions are stopped and the trip message will be displayed on the drive keypad. If a non permanent trip occurs this may be reset by power cycling the drive. On power up after it has been power cycled the drive will trip on Stored HF. The sub-trip code is the number of the original HF trip. Enter 1299 in **mm.000** to clear the Stored HF trip.

12.6 Alarm indications

In any mode, an alarm is an indication given on the KI-Remote Keypad display by alternating the alarm string with the drive status string on the first row and showing the alarm symbol in the last character in the first row. If an action is not taken to eliminate any alarm except "Auto Tune and Limit Switch" the drive may eventually trip. Alarms are not displayed when a parameter is being edited, but the user will still see the alarm character on the upper row.

Table 12-7 Alarm indications

Alarm string	Description
Brake Resistor	Brake resistor overload. <i>Braking Resistor Thermal Accumulator</i> (10.039) in the drive has reached 75.0 % of the value at which the drive will trip.
Motor Overload	Motor Protection Accumulator (04.019) in the drive has reached 75.0 % of the value at which the drive will trip and the load on the drive is >100 %.
Ind Overload	Regen inductor overload. <i>Inductor Protection Accumulator</i> (04.019) in the drive has reached 75.0 % of the value at which the drive will trip and the load on the drive is >100 %.
Drive Overload	Drive over temperature. <i>Percentage Of Drive Thermal Trip Level</i> (07.036) in the drive is greater than 90 %.
Auto Tune	The autotune procedure has been initialized and an autotune in progress.
Limit Switch	Limit switch active. Indicates that a limit switch is active and that is causing the motor to be stopped.

12.7 Status indications

Table 12-8 Status indications

Upper row string	Description	Drive output stage
Inhibit	The drive is inhibited and cannot be run. The Safe Torque Off signal is not applied to Safe Torque Off terminals or Pr 06.015 is set to 0.	Disabled
Ready	The drive is ready to run. The drive enable is active, but the drive inverter is not active because the final drive run is not active.	Disabled
Stop	The drive is stopped / holding zero speed.	Enabled
Run	The drive is active and running.	Enabled
Scan	The drive is enabled in Regen mode and is trying to synchronize to the supply.	Enabled
Supply Loss	Supply loss condition has been detected.	Enabled
Deceleration	The motor is being decelerated to zero speed / frequency because the final drive run has been deactivated.	Enabled
dc injection	The drive is applying dc injection braking.	Enabled
Position	Positioning / position control is active during an orientation stop.	Enabled
Trip	The drive has tripped and no longer controlling the motor. The trip code appears in the lower display.	Disabled
Active	The regen unit is enabled and synchronized to the supply.	Enabled
Under Voltage	The drive is in the under voltage state either in low voltage or high voltage mode.	Disabled
Heat	The motor pre-heat function is active.	Enabled
Phasing	The drive is performing a 'phasing test on enable'.	Enabled

Table 12-9 Option module and SD Card and other status indications at power-up

	manage at part	r			
First row string	Second row string	Status			
Booting	Parameters	Parameters are being loaded			
Drive parameters are being loaded from an SD Card					
Booting	User Program	User program being loaded			
User program is being loaded from a SD Card to the drive					
Booting	Option Program	User program being loaded			
User programslot X	m is being loaded fron	n an SD Card to the option module in			
Writing To	NV Card	Data being written to SD Card			
Data is being written to a SD Card to ensure that its copy of the drive parameters is correct because the drive is in Auto or Boot mode					
Waiting For	Power System	Waiting for power stage			
The drive is after power-		sor in the power stage to respond			
Waiting For	Options	Waiting for an option module			
The drive is waiting for the Options Modules to respond after power-up					
Uploading From	Options	Loading parameter database			
At power-up it may be necessary to update the parameter database held by the drive because an option module has changed or because					

12.8 Programming error indications

an applications module has requested changes to the parameter structure. This may involve data transfer between the drive an option modules. During this period 'Uploading From Options' is displayed

Following are the error message displayed on the drive keypad when an error occurs during programming of drive firmware.

Table 12-10 Programming error indications

Table 12-	10 Programming error ind	ications
Error String	Reason	Solution
Error 1	There is not enough drive memory requested by all the option modules.	Power down drive and remove some of the option modules until the message disappears.
Error 2	At least one option module did not acknowledge the reset request.	Power cycle drive.
Error 3	The boot loader failed to erase the processor flash.	Power cycle drive and try again. If problem persists, return drive.
Error 4	The boot loader failed to program the processor flash.	Power cycle drive and try again. If problem persists, return drive.
Error 5	One option module did not initialize correctly. Option module did not set Ready to Run flag.	Remove faulty option module.

	information	information	installation	installation	started	parameters	the motor	Optimization	Operation	PLC	parameters	Diagnostics	information

12.9 Displaying the trip history

The drive retains a log of the last ten trips that have occurred. *Trip 0* (10.020) to *Trip 9* (10.029) store the most recent 10 trips that have occurred where *Trip 0* (10.020) is the most recent and *Trip 9* (10.029) is the oldest. When a new trip occurs it is written to *Trip 0* (10.020) and all the other trips move down the log, with oldest being lost. The date and time when each trip occurs are also stored in the date and time log, i.e. *Trip 0 Date* (10.041) to *Trip 9 Time* (10.060). The date and time are taken from *Date* (06.016) and *Time* (06.017). Some trips have sub-trip numbers which give more detail about the reason for the trip. If a trip has a sub-trip number its value is stored in the sub-trip log, i.e. *Trip 0 Sub-trip Number* (10.070) to *Trip 9 Sub-trip Number* (10.079). If the trip does not have a sub-trip number then zero is stored in the sub-trip log.

If any parameter between Pr **10.020** and Pr **10.029** inclusive is read by serial communication, then the trip number in Table 12-5 is the value transmitted.

NOTE

The trip logs can be reset by writing a value of 255 in Pr 10.038.

12.10 Behaviour of the drive when tripped

If the drive trips, the output of the drive is disabled so the load coasts to a stop. If any trip occurs the following read only parameters are frozen until the trip is cleared. This is to help in diagnose the cause of the trip.

Parameter	Description
01.001	Frequency / speed reference
01.002	Pre-skip filter reference
01.003	Pre-ramp reference
02.001	Post-ramp reference
03.001	Frequency slaving demand / Final speed ref
03.002	Speed feedback
03.003	Speed error
03.004	Speed controller output
04.001	Current magnitude
04.002	Active current
04.017	Reactive current
05.001	Output frequency
05.002	Output voltage
05.003	Power
05.005	DC bus voltage
07.001	Analog input 1

If the parameters are not required to be frozen then this can be disabled by setting bit 4 of Pr 10.037.

13 UL listing information

This section is intended to be used in conjunction with the Digitax HD M75X Series Installation and Technical Guide.

13.1 **Scope**

All models are cUL Listed to Canadian and US requirements. The UL file reference is: NMMS / 7. E171230.

13.2 Applicant and Listee

Nidec Control Techniques Ltd

The Gro

Pool Road

Newtown

Powys

SY16 3BE

UK

13.3 Manufacturer

Products are manufactured at several sites worldwide.

Primary manufacturing site:

Nidec Industrial Automation UK Ltd

Unit 79

Mochdre Industrial Estate

Newtown

Powys

SY16 4LE

UK.

The Manufacturing Location Code is: 8D14

13.4 Model numbers

Model numbers are listed within the 'Ratings' section (Chapter 2 - Product Information) of the *Digitax HD M75X Series Installation and Technical Guide*.

13.5 Safety information

Appropriate installation warnings, cautions and notes are located in the Chapter 1 Safety information on page 8.

13.6 Adjustments

The Digitax HD M75X Series Installation and Technical Guide gives details of all safety-relevant adjustments intended for the user. The identification or function of each control or indicating device and fuse is clearly marked in the diagrams in the Digitax HD M75X Series Installation and Technical Guide.

Maintenance adjustments are also described in the *Digitax HD M75X Series Installation and Technical Guide*. They should only be made by qualified personnel. Clear warnings are provided where excessive adjustment could lead to a hazardous state of the Power Drive System (PDS), Complete Drive Module (CDM) or Basic Drive Module (BDM). Any special equipment necessary for making adjustments is specified and described in the 'Mechanical Installation' (Chapter 3) of the *Digitax HD M75X Series Installation and Technical Guide*.

13.7 Ratings

The electrical ratings are listed within the 'Ratings' section (Chapter 2 - Product Information) of the *Digitax HD* M75X Series Installation and Technical Guide.

13.8 Short circuit current rating

All drives:

5 kA when protected by Listed fuses as specified in the *Digitax HD M75X Series Installation and Technical Guide*.

100 kA when protected by recognized supplemental fuses as specified in the *Digitax HD M75X Series Installation and Technical Guide*.

13.9 Overvoltage category

The Over Voltage Category is OVC III.

OVC III applies to equipment permanently connected in fixed installations (Downstream of and including the main distribution board).

13.10 Input current, fuse ratings and cable sizes

Electrical installation shall be in accordance with the US National Electrical Code, the Canadian Electrical Code and any additional local codes, as required.

The ground (earth) connections and the DC power connections must use UL Listed ring terminals sized according to the field wiring. Only one cable is permitted to be connected to each field wiring terminal.

The recommended cable sizes and fuse ratings are shown in the 'Technical Data' (Chapter 6) of the *Digitax HD M75X Series Installation* and *Technical Guide*.

13.11 Motor cable size and maximum length

The recommended motor cable sizes and maximum length are shown in the 'Technical Data' (Chapter 6) of the *Digitax HD M75X Series Installation and Technical Guide*.

13.12 Multiple wiring arrangements

The drives are able to operate from either a single phase or a three-phase AC supply.

Additionally, the drives are able to operate from a DC supply with a range from 24 Vdc up to the maximum rated DC supply voltage.

It is possible for the drive to go from operating on a normal line power supply voltage to operating on a much lower supply voltage without interruption. The wiring arrangements are shown in the 'Electrical installation' (Chapter 4) of the *Digitax HD M75X Series Installation and Technical Guide*.

13.13 External 24 V supply

An external 24 Vdc supply is required to power the low voltage circuits within the drive. The low voltage circuits are isolated from the live circuits

The 24 V supply must be protected by a supplemental fuse.

Refer to the 'Electrical installation' (Chapter 4) of the *Digitax HD M75X* Series Installation and Technical Guide.

13.14 Common DC bus systems

Multiple drives can be connected together via a common DC bus. For further details, refer to 'Multi axis system design' (Chapter 5) of the Digitax HD M75X Series Installation and Technical Guide.

13.15 Solid state short circuit protection

Integral solid state short circuit protection is provided. However, this does not provide branch circuit protection.

In the event of a ground (earth) fault within the drive, the input protective devices (fuses or circuit breaker) provide overcurrent protection in the usual way.

All AC drives incorporate solid state short circuit protection. If a ground (earth) fault occurs in the motor circuit, the solid-state protection

Safety Product Mechanical Electrical Getting Basic Running SD Card Onboard Advanced **UL** listing Optimization Diagnostics informatio installation parameter Operation PLC parameters information

operates, the inverter trips and all power switches (IGBTs) are switched off within a very short time, typically less than 10 μ s. The total trip time is unlikely to exceed 100 μ s.

In the event of failure of the solid state short circuit protection, one or more of the inverter power devices then fails either open or short circuit. If the failure mode is open-circuit, the fault is interrupted. If the failure mode is short-circuit, the input protection devices (fuses or circuit breaker) clear the fault and open the circuit.

13.16 Motor overload protection

All models incorporate internal overload protection for the motor load that does not require the use of an external or remote overload protection device.

13.17 Motor overload protection and thermal memory retention

All drives incorporate internal overload protection for the motor load that does not require the use of an external or remote overload protection device. The protection level is adjustable and the method of adjustment is described in Chapter 8 *Optimization* on page 77.

The duration of the overload is dependent on motor thermal time constant. The maximum programmable time constant depends on the drive model. The method of adjustment of the overload protection is provided.

The drives are provided with user terminals that can be connected to a motor thermistor to protect the motor from high temperature, in the event of a motor cooling fan failure.

13.18 Enclosure rating

All drives are Open Type.

13.19 Mounting

Drives may be mounted

- Singly
- · Side by side
- Stacked one above another when fitted with a rear vent kit

The drives are equipped with a rear vent that allows heated air to be exhausted from the rear of the drive rather than the through the top. This mounting arrangement provides the following benefits:

- · Reduction in enclosure size.
- Allow vertical stacking of drives.
- Reduce the need for a secondary enclosure fan.

Refer to the 'Mechanical Installation' (Chapter 3) of the *Digitax HD M75X* Series Installation and Technical Guide.

For compact multi axis installations, the rear venting kit allows drives to be vertically mounted one above the other, where this is the case, a minimum clearance of 100 mm (3.94 in) should be maintained between drives.

A current derating must be applied to the drive if the rear vent kit is installed. Derating information is provided in the 'Technical Data' (Chapter 6) of the *Digitax HD M75X Series Installation and Technical Guide*. Failure to do so may result in nuisance tripping.

13.20 Operating temperature

The drives are suitable for use up to 40 °C (104 °F) surrounding air temperature. Operation up to 55 °C (131 °F) is permitted with de-rated output. Refer to the 'Technical Data' (Chapter 6) of the *Digitax HD M75X Series Installation and Technical Guide*.

13.21 Pollution degree

Drives are designed for operation in a pollution degree 2 environment or better (dry, non-conductive pollution only).

13.22 Plenum rating

The drives are not suitable for installation in a compartment (duct) handing conditioned air.
